Fill in the gaps in the following sentences using the words in the box below.

1. Enzymes are biological catalysts that speed up chemical reactions in living organisms.
2. Enzymes are protein molecules, which are made up of long chains of amino acids
3. The sequence and type of amino acids are different in each protein, so they produce enzymes with many different shapes and functions.

5. Enzymes and their substrates are often compared to a lock and key. This is called the Lock and Key Model. Label the lock and key in the image above.
6. Explain what would happen if a substrate molecule with a different shape to the enzyme came into contact with the enzyme's active site.

**In case of lock and key model of enzyme-catalyzed reactions, active site is a rigid site. A different shape of a substrate would not be entertained, hence there will be no reaction**

## **Answer Key To Enzyme Activity:**

**Cell Chemistry and Physiology: Part I** Edward Bittar, 1996-01-04 This is the first of a 4 volume module that is an introduction to the study of cell chemistry and physiology It is not intended to be encyclopedic in nature but rather a general survey of the subject with an emphasis on those topics that are central to an understanding of cell biology and those that are certain to become of increasing importance in the teaching of modern medicine We have followed what appeared to as to be the logical divisions of the subject beginning with proteins Allewell and her colleagues stress the point that proteins fold spontaneously to form complex three dimensional structures and that some of them unfold with the help of proteins called chaperones Michaelis Menten kinetics are shown by Nelsestuen to describe the behaviour of enzymes in the test tube The formalism is particularly useful in the search for agents of therapeutic value as exemplified by methotrexate Uptake by mammalian cells of substrates and their metabolic conversions are discussed by van der Vusse and Reneman However both Welch and Savageau expound the view that the cell is not simply a bagful of enzymes The biologist is urged by Savageau to abandon Michaelis Menten formalism and apply the Power Law The biologist is also told that the approach to arriving at a theory of metabolic control would have to be one of successive approximations requiring the use of the computer Information gained from comparative biochemistry is shown by Storey and Brooks to have shed new light on mechanisms of metabolic rate depression and freeze tolerance and to be applicable to organ transplantation technology We are reminded that enzyme adaptation is partly the result of the presence of a hydrating shell of vicinal water that stabilises conformation of the enzyme Vicinal water according to Drost Hausen and Singleton lies adjacent to most solids and protein interfaces The kinks or breaks observed in the slope of the Arrhenius plot are attributed to structural changes in vicinal water Regulation of cell volume is shown by Hempling to involve regulation of cell water It could be that the osmo receptor or volume detection system is a protein that links the cytoskeleton to specific K and C1 channels Additionally it is interesting that aquaporins which are water channel forming membrane proteins are now known to exist in both renal and extra renal tissues One of the renal porins is affected by vasopressin We then pass on to protein synthesis Rattan and other important topics including protein glycosylation Hounsell methylation Clarke ADP ribosylation Pearson and prenylation Gelb Among the four types of lipids attached to membrane proteins are the prenyl groups Ford and Gross in their chapter on lipobiology drive home the point that there is an accumulation of acyl carnitine and lysophospholipids during myocardial infarction      *CBSE Chemistry Important Questions Chapter wise Class 12* Priti Singhal, 2024-11-13
