The Foundations of Real Analysis Richard Mikula, 2015-10-20 This textbook covers the subject of real analysis from the fundamentals up through beginning graduate level It is appropriate as an introductory course text or a review text for graduate qualifying examinations Some special features of the text include a thorough discussion of transcendental functions such as trigonometric logarithmic and exponential from power series expansions deducing all important functional properties from the series definitions The text is written in a user friendly manner and includes full solutions to all assigned exercises throughout the text

Lectures on Symplectic Geometry Ana Cannas da Silva, 2004-10-27 The goal of these notes is to provide a fast introduction to symplectic geometry for graduate students with some knowledge of differential geometry de Rham theory and classical Lie groups This text addresses symplectomorphisms local forms contact manifolds compatible almost complex structures Kaehler manifolds hamiltonian mechanics moment maps symplectic reduction and symplectic toric manifolds It contains guided problems called homework designed to complement the exposition or extend the reader's understanding There are by now excellent references on symplectic geometry a subset of which is in the bibliography of this book However the most efficient introduction to a subject is often a short elementary treatment and these notes attempt to serve that purpose This text provides a taste of areas of current research and will prepare the reader to explore recent papers and extensive books on symplectic geometry where the pace is much faster For this reprint numerous corrections and clarifications have been made and the layout has been improved

Basic Analysis V James K. Peterson, 2021-09-12 Basic Analysis V Functional Analysis and Topology introduces graduate students in science to concepts from topology and functional analysis both linear and nonlinear It is the fifth book in a series designed to train interested readers how to think

properly using mathematical abstractions and how to use the tools of mathematical analysis in applications It is important to realize that the most difficult part of applying mathematical reasoning to a new problem domain is choosing the underlying mathematical framework to use on the problem Once that choice is made we have many tools we can use to solve the problem However a different choice would open up avenues of analysis from a different perhaps more productive perspective In this volume the nature of these critical choices is discussed using applications involving the immune system and cognition Features Develops a proof of the Jordan Canonical form to show some basic ideas in algebraic topology Provides a thorough treatment of topological spaces finishing with the Krein Milman theorem Discusses topological degree theory Brouwer Leray Schauder and Coincidence Carefully develops manifolds and functions on manifolds ending with Riemannian metrics Suitable for advanced students in mathematics and associated disciplines Can be used as a traditional textbook as well as for self study Author James K Peterson is an Emeritus Professor at the School of Mathematical and Statistical Sciences Clemson University He tries hard to build interesting models of complex phenomena using a blend of mathematics computation and science To this end he has written four books on how to teach such things to biologists and cognitive scientists These books grew out of his Calculus for Biologists courses offered to the biology majors from 2007 to 2015 He has taught the analysis courses since he started teaching both at Clemson and at his previous post at Michigan Technological University In between he spent time as a senior engineer in various aerospace firms and even did a short stint in a software development company The problems he was exposed to were very hard and not amenable to solution using just one approach Using tools from many branches of mathematics from many types of computational languages and from first principles analysis of natural phenomena was absolutely essential to make progress In both mathematical and applied areas students often need to use advanced mathematics tools they have not learned properly So he has recently written a series of five books on mathematical analysis to help researchers with the problem of learning new things after they have earned their degrees and are practicing scientists Along the way he has also written papers in immunology cognitive science and neural network technology in addition to having grants from the NSF NASA and the US Army He also likes to paint build furniture and write stories
