

A software company decided to move some of their web services from one cloud provider (Vendor A) to another (Vendor B) for better cost optimization. Initially, their main web application "webapp.company.com" was hosted at IP 192.0.2.1 on Vendor A's infrastructure. As part of this transition, it was moved to IP 203.0.113.1 on Vendor B's setup. Subsequently, a secondary web service previously hosted on "serviceA.company.com" at IP 192.0.2.2 (Vendor A), was migrated and re-hosted at "serviceB.company.com" at IP 203.0.113.2 (Vendor B).

A month post-migration, the SEO team reported an unexpected spike in organic traffic to the "company.com" domain. Upon investigating, the IT team noticed unusual activity related to "serviceA.company.com" in the server access logs, including successful HTTP 200 responses from several requests. A suspicious HTTPS GET request, GET /explicit-content.html HTTP/1.1, was also recorded.

Running `dig +short serviceA.company.com` returned IP address 198.51.100.1. Cross-checking this information with the company's DNS records revealed:

```
1 webapp.company.com. 3600 IN A 203.0.113.1
2 serviceA.company.com. 3600 IN A 198.51.100.1
3 serviceB.company.com. 3600 IN A 203.0.113.2
```

Based on the details provided, identify the probable cause for the unexpected increase in organic traffic:

- A: The company failed to delete the DNS "A" record for "serviceB.company.com" before migration on vendor A.
- B: The company failed to delete the DNS "A" record for "serviceA.company.com" after migration.
- C: The company did not configure DNS record for webapp.company.com properly on Vendor B's platform.
- D: The DNS configuration for serviceB.company.com is incorrect post migration

☐ A
