The pervasiveness of information and technology in our everyday lives has led to an increase in the significance of cybersecurity in the contemporary day. The Introduction to Cybersecurity module, which is a core component of the wider cybersecurity course, must be completed by students who are starting their investigation of digital defense. As the first step in laying the framework for what is to come, this subject begins with an in-depth investigation of the concepts, principles and challenges that constitute the basis of cybersecurity. With the simple press of a button, we are able to transmit and receive any sort of data, whether it be an audio file, a video clip or an electronic mail message. On the other hand, have we ever given any thought to the integrity of the data that is being sent, making certain that no information is disclosed? It is possible for security to be compromised via the use of paper documents, fax machines and even interpersonal conversation. Security breaches that include digital information may have substantially more severe repercussions than those that involve traditional information, since digital information may be transmitted more easily and to a significantly broader audience. The answer lies in internet security. With regard to the infrastructure that is considered to be conventional, the Internet is now increasing at a pace of knots.

Wireless Hardware Arduino Control Add-on Using Bluetooth Matteo Barreca,2014 **Design of an Integrated Battery Charging System for Both Wired and Wireless Charging for Battery Electric and Hybrid Vehicles** Mohamed A.

Elshaer,2020 With the continuous drop in the HV battery cost Electric Vehicles are forecasted to become increasingly affordable However with more services being added to electric vehicles the onboard system complexity and cost continues to increase Currently plug in electric vehicles require an onboard conductive charger to regulate the power delivered to the HV battery and isolate the HV bus from the AC grid In some cases electric vehicles may offer the option for supplying AC power to connected loads thus providing the flexibility of using the onboard HV battery as a mobile source Moreover with increased consumer demand for hands free charging wireless power transfer can potentially be considered as an addon option to serve as an HV battery charger Unfortunately due to the limited onboard space and the high cost of the power conversion system adoption of the wireless power transfer technology has not gained traction This dissertation provides a comprehensive study outlining the challenges with adding a wireless HV battery charger to battery electric and plug in hybrid vehicles Through system architecture analysis a case is made for why there is a need to consolidate the redundant onboard circuit blocks through system level integration Opportunities for reducing the onboard bill of material cost and reducing the size of the onboard electronics are provided Moreover the technological challenges with the overall power conversion efficiency as it pertains to a highly integrated system are discussed Also the challenge of realizing system interoperability with the public charging infrastructure for the wireless power transfer system is addressed Battery electric and plug in hybrid vehicles capable of wirelessly charging the HV battery have the advantage of charging while in motion during frequent stops and automatically in public designated parking areas With such flexibility in receiving power the battery size can be reduced allowing for a reduction in vehicle weight and cost While the wireless power transfer WPT technology has matured to the point that standards are being developed for it the monetary cost of this technology remains high Innovation in both the ground infrastructure and onboard vehicle electronics remains a necessity There is a need for new methodologies and test procedures to enable the development of new vehicle systems that are interoperable with the public ground infrastructure These design guidelines need to provide enough flexibility for innovation to occur in both the ground and vehicle subsystems The dissertation starts with analyzing the state of art HV battery charging architecture for a wireless capable plug in electric vehicle Through system analysis an optimal onboard charging architecture is proposed to minimize the size and bill of material cost of the onboard electronics The methodology proposed by SAE J2954 for qualifying the interoperability of product ground assemblies and product vehicle assemblies is analyzed in detail Challenges in realizing system interoperability between an optimized highly integrated vehicle assembly and the public infrastructure are discussed The wireless power transfer figure of merit FOM is redefined to consider the impedance matching capability The ratio between the energy stored in the magnetic field and transferred power is derived to optimize the driving point impedance which in turn determines the efficiency of the system Furthermore it will be shown that when the ground assembly GA and vehicle assembly VA are independently characterized the magnetic coupling and power transfer between them can be quantified

with relatively high accuracy. The goal for this work is to formulate the mathematical equations needed to describe a resonator by an equivalent source thus allowing independent characterization of the transmitter and receiver subsystems. A new methodology for designing and testing wireless power transfer systems for electric vehicles is proposed. To realize a technologically neutral way for developing the transmitter and receiver parts of the system a technique for constructing a separate equivalent circuit model for each subsystem using a scan of the magnetic field is proposed. Through the utilization of a reference source impedance constraints are developed so that the transmitter side of the circuit is designed and tested independently from the receiver side of the circuit and vice versa. Finally a systematic approach for optimizing the onboard system architecture is provided. Through system simulation and hardware validation it will be demonstrated that a highly integrated onboard battery charging architecture can achieve full interoperability with the public wireless charging infrastructure without sacrificing the performance of either the onboard conductive charger or wireless power transfer system. A novel topology for integrating the receiver coil of a wireless power transfer system with the electric vehicle's onboard bidirectional conductive charger is proposed. Through component sharing between the two subsystems a reduction in the overall size and cost of the onboard electronics is achieved. Furthermore by utilizing GaN HEMT devices the DC-DC stage achieved an efficiency of 95.6% when transferring 5 kW via the onboard charger and 93.4% when transferring 7.7 kW via the wireless power transfer system. Conclusions and recommendations for future work are presented.
