Warren, Naama W. Constantini, 2000-05-01 Since the observation in the 19th century that an extract of the suprarenal bodies injected into the circulation caused a rise in blood pressure the endocrine system has become a major component in our understanding of human physiology The introduction of radioimmunoassay techniques and the ability to measure minimal amounts of hormones a term derived from the Greek to excite have shown that acute exercise causes a release of a large number of hormones and that chronic exercise may further lead to long term alterations in endocrine homeostasis Actually almost every organ and system in the body is affected by physical activity and exercise much of it through the endocrine and neuroendocrine system Investigation of the effect of acute or chronic physical activity on the endocrine system is a complex matter since the stimulus called exercise has many components such as mode intensity duration and others In addition several other factors such as age gender training status body temperature circadian rhythm metabolic state menstrual cycle

and various external conditions as well as psychological factors can modify the effect of physical activity on hormonal secretion. Moreover, the physiological stimulus of exercise often provokes several and parallel cascades of biochemical and endocrine changes. It is therefore often extremely difficult to distinguish between primary and secondary events and between cause and effect. These limitations will be discussed in Chapter 1.
