

The Analysis of Biological Data - Whitlock and Schluter

Solutions to practice problems

Chapter 1

1. **(a)** Ordinal **(b)** Nominal **(c)** Nominal **(d)** Ordinal
2. **(a)** Observational (cats were observed to fall a given number of stories—the researchers did not assign the number of stories fallen to the cats). **(b)** The number of floors fallen. **(c)** The number of injuries per cat.
3. **(a)** Discrete **(b)** Continuous **(c)** Discrete **(d)** Continuous
4. **(a)** Collectors do not usually sample randomly, but prefer rare and unusual specimens. Therefore, the moths are probably not a random sample. **(b)** A sample of convenience. **(c)** Bias (rare color types are likely to be over-represented in the sample compared with the population).
5. Accuracy.
6. **(a)** Categorical **(b)** No random sampling procedure was followed so the survey is not random; the respondents were volunteers. **(c)** Volunteer bias (those most interested in the issue were more likely to respond).
7. **(a)** US army personnel stationed in Iraq. **(b)** Yes. The number of subjects interviewed was a random sample of only 100 from the population; therefore the responses of the particular individuals who happened to be sampled will differ from the population of interest by chance. **(c)** The advantage of random sampling is that it minimizes bias and allows the precision of estimates of stress levels to be measured.
8. **(a)** The population being estimated is all the small mammals of Kruger National Park. **(b)** No, the sample is not likely to be random. In a random sample, every individual has the same chance of being selected. But some small mammals might be easier to trap than others (for example, trapping only at night might miss all the mammals active only in the day time). In a random sample individuals are selected independently. Multiple animals caught in the same trap might not be independent if they are related or live near one another (this is harder to judge). **(c)** The number of species in the sample might underestimate the number in the Park if sampling was not random (e.g., if daytime mammals were missed), or if rare species happened to avoid capture. In this case \bar{w} would be a biased estimate of M .
9. Chicks were not sampled randomly. The multiple chicks from the same nest are not independent. Chicks from the same nest are likely to be more similar to one another in their measurements than chicks chosen randomly from the population. Ignoring this problem will lead to erroneous measurements of the precision of survival estimates, sampled randomly from the population.
