Price Elasticity of Demand

- Price elasticity of demand measures how much Q^D responds to a change in P .
- Expresses the price sensitivity of demand's response.

$$\text{Price elasticity of demand} = \frac{\text{Percentage change in } Q^D}{\text{Percentage change in } P}$$

Using a demand curve, P and Q move in opposite directions, which means that price elasticity is negative. Use the graph to illustrate this and explain why the demand curve is downward-sloping.

Example:

The demand curve for a product is downward-sloping and linear. The price elasticity of demand is -1 at the midpoint of the curve.

Calculating Percentage Changes

Price elasticity of demand is calculated as follows:

Price elasticity of demand = $\frac{\text{Percentage change in } Q^D}{\text{Percentage change in } P}$
