

9TH GRADE BIOLOGY LEARNING PACKET Scientific Method

Science is an organized way of gathering and analyzing evidence about the natural world. The goals of science are to provide natural explanations for events in the natural world and to use those explanations to make useful predictions. Science is different from other human works in the following ways:

- Science deals only with the natural world.
- Scientists collect and organize information about the natural world in an orderly way.
- Scientists propose explanations that are based on evidence, not belief.
- They test those explanations with more evidence.

Methodology for scientific investigation involves:

- Making an **observation**: Observation involves the act of noticing and describing events or processes in a careful, orderly way. Scientists use their observations to make inferences. An **inference** is a logical interpretation based on what scientists already know.
- Suggesting hypotheses: A **hypothesis** is a scientific explanation for a set of observations that can be tested in ways that support or reject it.
- Testing the hypothesis: Testing a hypothesis often involves designing an experiment. Whenever possible, a hypothesis should be tested by a **controlled experiment** - an experiment in which only one variable (the **independent variable**) is changed. The variable that can change in response to the independent variable is called the **dependent variable**. The **control group** is exposed to the same conditions as the experimental group except for the independent variable. It shows what would happen if no variable were changed.
- Collecting, recording, and analyzing **data** or information gathered during the experiment.
- Drawing conclusions based on data and sharing the conclusion with others.

QUESTIONS-

1. What is science?
2. What are the goals of science?
3. Read the following experimental scenario and identify the components of the scientific method:

A student investigated whether ants dig more tunnels in light or in the dark. She thought that ants used the filtered light that penetrated the upper layers of earth and would dig more tunnels during the daytime. Ten ant colonies were set up in commercial ant farms with the same number and type of ants per ant farm. The same amount of food was given to each colony, and the colonies were kept at the same temperature. Five of the colonies were exposed to normal room light, and five were covered with black construction paper so they did not receive light. Every other day for three weeks the length of the tunnels was measured in millimeters using a string and ruler. Averages for the light and dark groups measurements were then computed. The averages were listed in the following chart:
