Abstract: This study examined the effects of a 12-week, 100% bodyweight resistance training program on the strength and body composition of 10 sedentary, middle-aged men. The program consisted of three sessions per week, each targeting a different muscle group. The results showed that the participants experienced significant increases in muscle strength and body composition, including increases in muscle mass and decreases in body fat. The findings suggest that a 12-week, 100% bodyweight resistance training program can be an effective means of improving strength and body composition in sedentary, middle-aged men.
