

## Purpose

To compare your model of the atom with the model of the atom proposed by the Bohr model.

## Step 1: Using Mathematics for Electron Orbits

In this step, you will use the model of the atom proposed by the Bohr model to calculate the radius of the electron orbits. The Bohr model of the atom is based on the assumption that the electron orbits the nucleus in a circular path. The radius of the orbit is given by the following equation:

$$r_n = n^2 a_0$$

where  $r_n$  is the radius of the orbit,  $n$  is the principal quantum number, and  $a_0$  is the Bohr radius (0.529 Å).

Using the equation, calculate the radius of the orbit for the electron in the  $n=1$  state. (Bohr model)

It is assumed that the electron orbits the nucleus in a circular path. The Bohr model of the atom is based on the assumption that the electron orbits the nucleus in a circular path.

Calculate the radius of the orbit for the electron in the  $n=2$  state. (Bohr model)

Now, the Bohr model of the atom is compared with the Bohr model of the atom proposed by the Bohr model.

It is assumed that the electron orbits the nucleus in a circular path. The Bohr model of the atom is based on the assumption that the electron orbits the nucleus in a circular path.

Calculate the radius of the orbit for the electron in the  $n=3$  state. (Bohr model)

Now, the Bohr model of the atom is compared with the Bohr model of the atom proposed by the Bohr model.

It is assumed that the electron orbits the nucleus in a circular path. The Bohr model of the atom is based on the assumption that the electron orbits the nucleus in a circular path.
