The difference between an observation and an inference is that an observation is what you see, while an inference is a guess, or what you think you're going to see.
2. What is needed to have a good scientific claim?  
What you need to have a good scientific claim is when you have enough evidence to support your answers and proof of your claim.
3. How do scientists determine if a claim is valid?  
Scientists determine if a claim is valid or not by doing the experiment or observation again to make sure the claim is valid.
4. Describe the following as used in a scientific experiment:
  - a. Independent variable: the factor that directly changes the scientific experiment.
  - b. Dependent variable: the factor that is observed or measured in an experiment.
  - c. Methods/ procedures: Detailed steps to conduct the experiment.
  - d. Control group: the group of a subject that is not exposed with independent variable.
  - e. Experimental constants: Factors that remain unchanged throughout an experiment.
  - f. Collected data: Information that is gathered.
  - g. Graphs/tables/charts/formulas: tools that are used to collect data in an experiment.
  - h. Analysis/ conclusions: interpretation of the data to collect meaningful thoughts on how your hypothesis went.
5. Which sources of information are considered reliable (Hint: it is not Google, Bing or Wikipedia) for scientific investigations?  
Sources with the extension .gov or verified sources by trusted scientists.
6. Explain the difference between a scientific theory (like evolution) and a scientific law (like the law of gravity)  
Scientific laws are rules for how nature will behave under specific conditions, usually written as a complicated equation, while scientific theories are complicated explanations about how nature works and why it has those characteristics.
7. When do scientists use models?  
Scientists use models to explain something very complicated, or when they cannot study it up close.
