Handbook of Water Resources Management: Discourses, Concepts and Examples Janos J. Bogardi, Joyeeta Gupta, K. D. Wasantha Nandalal, Léna Salamé, Ronald R.P. van Nooijen, Navneet Kumar, Tawatchai Tingsanchali, Anik Bhaduri, Alla G. Kolechkina, 2021-06-12 This book provides an overview of facts theories and methods from hydrology, geology, geophysics, law, ethics, economics, ecology, engineering, sociology, diplomacy, and many other disciplines with relevance for concepts and practice of water resources management. It provides comprehensive but also critical reading material for all communities involved in the ongoing water discourses and debates. The book refers to case studies in the form of boxes, sections, or as entire chapters. They illustrate success stories but also lessons to be remembered to avoid repeating the same mistakes. Based on consolidated state of the art knowledge, it has been conceived and written to attract a multidisciplinary audience. The aim of this handbook is to facilitate understanding between the participants of the international water discourse and multi level decision making processes. Knowing more about water but also about concepts, methods, and aspirations of different professional disciplinary communities and stakeholders, professionalizes the debate and enhances the decision making.

Biomass Modification, Characterization and Process Monitoring Analytics to Support Biofuel and Biomaterial Production Robert Henry, Blake Simmons, Jason Lupoi, 2016-06-09 The conversion of lignocellulosic biomass into renewable fuels and other commodities has provided an appealing alternative towards supplanting global dependence on fossil fuels. The suitability of multitudes of plants for deconstruction to useful precursor molecules and products is currently being evaluated. These studies have probed a variety of phenotypic traits including cellulose, non-cellulosic polysaccharide, lignin, and lignin monomer composition, glucose and xylose production following enzymatic hydrolysis, and an assessment of lignin carbohydrate and lignin-lignin linkages to name a few. These quintessential traits can provide an assessment of biomass recalcitrance enabling researchers to devise appropriate deconstruction strategies. Plants with high polysaccharide and lower lignin contents have been shown to breakdown to monomeric sugars more readily. Not all plants contain ideal proportions of the various cell wall constituents; however, the capabilities of biotechnology can alleviate this conundrum by tailoring the chemical composition of plants to be more favorable for conversion to sugars, fuels, etc. Increases in the total biomass yield, cellulose content, or conversion efficiency through, for example, a reduction in lignin content, are pathways being evaluated to genetically improve plants for use in manufacturing biofuels and bio-based chemicals. Although plants have been previously domesticated for food and fiber production, the collection of phenotypic traits prerequisite for biofuel production may necessitate new genetic breeding schemes. Given the plethora of potential plants available for exploration, rapid analytical methods are needed to more efficiently screen through the bulk of samples to hone in on which feedstocks contain the desired chemistry for subsequent conversion to valuable renewable commodities. The standard methods for analyzing biomass and related intermediates and finished products are laborious, potentially toxic, and/or destructive. They may also

necessitate a complex data analysis significantly increasing the experimental time and add unwanted delays in process monitoring where delays can incur in significant costs Advances in thermochemical and spectroscopic techniques have enabled the screening of thousands of plants for different phenotypes such as cell wall cellulose non cellulose polysaccharide and lignin composition lignin monomer composition or monomeric sugar release Some instrumental methods have been coupled with multivariate analysis providing elegant chemometric predictive models enabling the accelerated identification of potential feedstocks In addition to the use of high throughput analytical methods for the characterization of feedstocks based on phenotypic metrics rapid instrumental techniques have been developed for the real time monitoring of diverse processes such as the efficacy of a specific pretreatment strategy or the formation of end products such as biofuels and biomaterials Real time process monitoring techniques are needed for all stages of the feedstocks to biofuels conversion process in order to maximize efficiency and lower costs by monitoring and optimizing performance These approaches allow researchers to adjust experimental conditions during rather than at the conclusion of a process thereby decreasing overhead expenses This Frontiers Research Topic explores options for the modification of biomass composition and the conversion of these feedstocks into biofuels or biomaterials and the related innovations in methods for the analysis of the composition of plant biomass and advances in assessing up and downstream processes in real time Finally a review of the computational models available for techno economic modeling and lifecycle analysis will be presented
