

uses the motor in a vertical position and permits reverse operation by overcoming engine thrust. The "RELEASE" position is only recommended when operating in shallow or obstructed waters.

In a forward direction the reverse lock utilizes an automatic tilt feature which is designed to release upon striking an underwater object, thus allowing the motor to tilt.

**CAUTION** - When operating in reverse, additional care should be exercised as the motor obviously has no automatic tilt protection.

To tilt the motor, move reverse lock to "RELEASE" position, grasp the tilt grip at rear of motor cover and pull motor toward you. As a safety precaution always disconnect fuel line from motor when trailing or when motor is tilted on boat.

#### PROPER ANGLE ADJUSTMENT

The stern bracket has four holes for adjusting the motor to a vertical position to allow for trim-on angle. Adjust motor angle as follows:

1. Place reverse lock lever in "RELEASE" position and tilt motor away from transom.
2. Release tilt adjusting rod retainer and remove rod from stern brackets. Place rod in second hole from boat. Make sure rod retainer drops into lock position.
3. Move motor back against rod and place reverse lock in "LOCK" position so motor is perpendicular to water when boat is under way.

The vertical angle of the motor on the boat must be adjusted properly to obtain best performance from the motor and boat. The correct angle can only be determined by observing how the boat operates at full speed. See "How to Get Peak Performance." This angle adjustment should be made when trim and load distribution change. Placing type boat should ride with bow slightly out of water at full throttle.
