Actinobacteria in Special and Extreme Habitats: Diversity, Function Roles and Environmental Adaptations Sheng Qin,Wen-Jun Li,Syed G. Dastager,Wael N. Hozzein,2016-11-09 Actinobacteria are highly diverse prokaryotes that are ubiquitous in soil freshwater and marine ecosystems Although various studies have focused on the ecology of this phylum data are still scant on the diversity abundance and ecology of actinobacteria endemic to special and extreme environments such as gut plant alkaline saline soil deep sea sediments hot springs and other habitats Actinobacteria are well known producers of a vast array of secondary metabolites many of which have useful applications in medicine and agriculture Furthermore actinobacteria also have diverse functions in different environments apart from antibiotic production For example actinobacteria are reported to contribute to the break down and recycling of organic compounds They play a significant role in fixation of nitrogen improvement plant growth biodegradation bioremediation and environmental protection Therefore understanding the actinobacterial diversity and distribution in such special environments is important in deciphering the ecological roles of these microorganisms and for biotechnological bioprospecting Recent advances in cultivation DNA sequencing technologies and omics metagenomics metaproteomics etc methods have greatly contributed to the rapid advancement of our understanding of microbial diversity function and they interactions with environment Furthermore comparative genomic studies can provide overall information about actinobacterial speciation evolution metabolism and environment adaptation mechanisms This research topic comprising reviews and original articles highlights the recent advances regarding the unexpectedly diverse rare group of actinobacteria with special selective isolation methods or culture independent methods as well as their biological activities ecophysiological function and mechanisms from diverse special and extreme environments

Actinobacteria, a Source of Biocatalytic Tools Dirk Tischler,Willem J. H. van Berkel,Marco W. Fraaije,2019-08-12

Actinobacteria Actinomycetes represent one of the largest and most diverse phyla among Bacteria The remarkable diversity is displayed by various lifestyles distinct morphologies a wide spectrum of physiological and metabolic activities as well as genetics Interestingly most Actinobacteria have a high GC content ranging from 51% to 70% and belong to Gram positive or Gram variable type microbes Many species are well known for large genomes which may be of linear style as in case of rhodococci or circular Many of those harbor linear megaplasmids as a kind of genetic storage device Frequently gene redundancy is reported and in most cases the evolutionary history or a functional role remains enigmatic Nevertheless these large genomes and megaplasmids provide access to a number of potential homologous biocatalysts which await elucidation Actinobacteria are well known for their biotechnological potential which is exemplarily described for amino acid producing Corynebacteria secondary metabolite producing Streptomyces pathogenic targets as Nocardia and Mycobacteria carotenoid building Micrococcus strains acid fermenting Propionibacteria health and food related Bifidobacterium strains rubber degrading Gordonia species and organic pollutant degrading rhodococci among others In many cases individual pathways or enzymes can be modified or recombinantly employed for biocatalysis Even some genetic tools to work directly in those microbes have been successfully used as for example in Corynebacterium or in Rhodococcus species During the last decade more and more genomes have been sequenced and made available for data mining and become accessible by state of the art genomic manipulation methods as minimal genomes knock out or artificial evolution With respect to this large and ancient phylum many questions can be asked either from a scientific or industrial point of view In order to provide some crystallization points we like to raise some examples as follows How small can be an actinobacterial genome What is the driving force to comprise large and repetitive genomes megaplasmids What is needed to generate an actinobacterial power house for industry Can we annotate novel biocatalysts from scratch and improve functional annotation What are common and different features with respect to other bacteria and or fungi How many novel antibiotics are hidden among Actinobacteria Is there more potential among extremophile members or are they only specialized Here especially the production of natural compounds is of high interest
