Best Management Practices for Saline and Sodic Turfgrass Soils Robert N. Carrow,Ronny R. Duncan,2011-09-12 The complex issues involved in the management of saline and sodic turfgrass soils are enough to perplex even the most experienced site manager there is no silver bullet amendment treatment or grass for salinity management Best Management Practices for Saline and Sodic Turfgrass Soils Assessment and Reclamation presents comprehensive scientific principles and detailed practical management and assessment recommendations for turfgrass and landscape sites The authors use the Best Management Practices BMPs concept considered the gold standard management approach for any

individual environmental issue since it is a whole ecosystem holistic science based salinity management approach that allows all possible management options to be considered and implemented on a site specific basis. They identify BMP strategies including irrigation system design, irrigation scheduling and salinity leaching chemical, physical and biological amendments, cultivation, topdressing, soil modification, sand capping, surface and subsurface drainage options, nutritional practices, additional cultural practices and ongoing monitoring. The book presents emerging challenges, technology and concepts that address integration of salinity management into comprehensive site environmental or sustainable management systems, use of halophytic turfgrasses for non traditional purposes, integration of geospatial and geostatistical concepts and technology, and integration of new sensor technology into daily management paradigms. Outlining a holistic BMP approach, the book incorporates scientific principles and practical management recommendations and details specific salinity challenges and the logic behind each BMP strategy for salinity management with an emphasis on actual field problems. The book is formatted for flexible use with stand alone chapters that include outlines for quick review of a topic for those requiring only a basic understanding as well as in depth discussions of the science and practical aspects for those seeking a more rigorous treatment. It supplies a single source for all the information required to identify and manage diverse types of salinity stresses.

The Science Teacher, 2009 **Nature-based Solutions for Circular Management of Urban Water** Alexandros Stefanakis, Hasan Volkan Oral, Cristina Calheiros, Pedro Carvalho, 2024-03-12

Despite the strong economic growth of the last decades our modern global society is facing the existential threat of climate change. It is now realized that the linear economic model is not sustainable in the long run and cannot sustain the life standards. The new circular economy approach that is already under discussion suggests the adjustment of our priorities and the re orientation of the future infrastructure investments. In this context we are looking for new innovative and sustainable solutions to increase the resiliency of our societies to protect and restore the ecosystems and to maintain the necessary economic growth without further undermining the planet's boundaries. The well being of coming generations will depend on our ability to adapt our economies to this challenge. In particular transforming today's cities into sustainable cities is one of the main adaptations that will be necessary. A holistic approach looking at cities from a system's perspective is needed to achieve this goal. Nature based solutions (NbS) serve exactly this ambitious and multi factorial purpose due to their inherent ability not only to tackle climate change but also to provide a series of ecosystem services and social benefits. In the urban context NbS can deal with main challenges such as urban heat islands, flooding, treatment of wastewater and runoff, and food provision. At the same time NbS can provide a series of ecosystem services beneficial for the environment and the society including clean water production, nutrient recovery, heavy metals retention and a broad range of plant based materials. In the new circular economy paradigm NbS can contribute to strategies for climate change adaptation and create a holistic resource management system for the urban biosphere. Thus this book aims at providing a single reference that discusses the role and effectiveness of NbS in the urban

environment and how these systems can contribute to the circular management of water nutrients and resources towards resilient sustainable and healthy cities The scope of the book extends to various fields and disciplines such as the built environment urban water and wastewater resource recovery urban farming smart sensing research and development technology and innovation society and governance Research studies pilot projects and case studies are part of the book
