

# 11 THE CARDIOVASCULAR SYSTEM

The major structures of the cardiovascular system, the heart and blood vessels, play a vital role in human physiology. The major function of the cardiovascular system is transportation. Using blood as the transport vehicle, the system carries nutrients, gases, wastes, antibodies, electrolytes, and many other substances to and from body cells. Its propulsive force is the contracting heart.

The anatomy and location of the heart and blood vessels and the important understandings of cardiovascular physiology (for example, cardiac cycle, ECG, and regulation of blood pressure) are the major topics of this chapter.

Despite achievements in the management of cardiovascular disease CVD over the last 50 years CVD remains a primary cause of global morbidity and mortality in both emerging and developed economies Due to the rising aging population in combination with an increase in cardiometabolic risk factors the number of individuals affected by CVD is currently on the rise Therefore it is of utter importance to develop new strategies aimed at reducing CVD risk and elucidate the molecular mechanisms and important players of CVD including atherosclerosis and plaque rupture and erosion Over the past years it became evident that a specific CVD atherosclerosis is a multifactorial disease that is not only driven by lipids but also by inflammation Compelling evidence that inflammation and the immune system play a crucial role in atherosclerotic CVD was provided by the landmark Canakinumab Anti inflammatory Thrombosis Outcomes Study CANTOS performed in 2017 Here it was shown that a monoclonal antibody targeting interleukin 1b IL 1b termed Canakinumab effectively reduced CVD risk and mortality especially in patients characterized with residual inflammation This effect was independent of lipid level lowering In late 2019 the inflammation hypothesis of atherosclerosis was confirmed in the Colchicine Cardiovascular Outcomes Trial COLCOT using the anti inflammatory agent colchicine in patients with recent myocardial infarction A follow

up study in 2020 applying colchicine in a randomized trial involving patients with chronic coronary disease LoDoCo also showed significant risk reduction These landmark studies set the stage for identifying drug targets that block atherosclerosis specific inflammatory pathways as a highly promising strategy to reduce cardiovascular risk
