Agroecology Anand M. R., Poojitha Kommireddy, Seenappa C., Kalyana Murthy K. N., Ningaraju G. K., 2023-12-01

Agroecology literacy is the degree to which people have an objective and well-informed understanding of crop production with environmental issues. The increased food grain production has also increased the unscientific and indiscriminate use of agrochemicals, which has affected the soil health and degraded agroecosystems adversely and brought down the immunity of soil and the productivity of crops. In addition, it has resulted in the overexploitation of soil, leading to nutrient imbalance. Moreover, the negative impact of chemical agriculture on the environment and human health has been reported and documented. Increased environmental awareness and health consciousness promoted scientists and planners to think about sustainable farming practices as an alternate way for healthy agriculture to protect the environment and human health. Eco-friendly methods or ecosystem services are one solution to manage this issue. This book intends to provide the core elements of a curriculum for teaching agroecology at colleges and universities. Drain for Gain: Making Water Management Worth its Salt Henk Ritzen, 2026-02-02. Salinity affects 10 to 16% of all irrigated lands while the annual rate of land loss due to waterlogging and salinity is about 0.5 million hectares per year. In this dissertation, the role of subsurface drainage to reduce these problems in irrigated agriculture in arid and semi-arid regions has been analysed and challenges for improving subsurface drainage practices have been formulated. Although the installed subsurface drainage systems are in general technically sound and cost-effective, drainage development lags behind irrigation development and consequently a substantial part of the irrigated areas suffers from waterlogging and salinity. This is mainly because the

subsurface drainage systems are designed and implemented by government with the users the small farmers having little responsibility and having little input In the adopted top down approach the location specific conditions and farmers preferences are hardly taken into consideration Furthermore the emphasis has been on the technical aspects the physical infrastructure while the organizational aspects institutional infrastructure have been largely neglected To reverse the negative trend in salt build up and waterlogging in irrigated lands in semi arid and arid regions a number of challenges for enhancing the role of subsurface drainage have been formulated i balancing top down against bottom up ii from standardization to flexibility and iii focus on capacity development
