Council**

2015 Maths Checkpoint Mark Scheme:

Mathematical Modeling and Computational Predictions in Oncoimmunology Vladimir A. Kuznetsov, Heiko Enderling, Mark Chaplain, 2024-06-06 Cancer is a complex adaptive dynamic system that causes both local and systemic failures in the patient Cancer is caused by a number of gain of function and loss of function events that lead to cells proliferating without control by the host organism over time In cancer the immune system modulates cancer cell population heterogeneity and plays a crucial role in disease outcomes The immune system itself also generates multiple clones of different cell types with some clones proliferating quickly and maturing into effector cells By creating regulatory signals and their networks and generating effector cells and molecules the immune system recognizes and kills abnormal cells Anti cancer immune mechanisms are realized as multi layer nonlinear cellular and molecular interactions A number of factors determine the outcome of immune system tumor interactions including cancer associated antigens immune cells and host organisms
