Algorithms M. H. Alsuwaiyel,1999 Problem solving is an essential part of every

scientific discipline It has two components 1 problem identification and formulation and 2 solution of the formulated problem One can solve a problem on its own using ad hoc techniques or follow those techniques that have produced efficient solutions to similar problems This requires the understanding of various algorithm design techniques how and when to use them to formulate solutions and the context appropriate for each of them This book advocates the study of algorithm design techniques by presenting most of the useful algorithm design techniques and illustrating them through numerous examples

bestseller in its French edition this book is original in its construction and its success in the French market demonstrates its
appeal It is based on three principles 1 An organization of the chapters by families of algorithms exhaustive search divide and
conquer etc On the contrary there is no chapter devoted only to a systematic exposure of say algorithms on strings Some of
these will be found in different chapters 2 For each family of algorithms an introduction is given to the mathematical
principles and the issues of a rigorous design with one or two pedagogical examples 3 For the most part the book details 150
problems spanning seven families of algorithms For each problem a precise and progressive statement is given More
importantly a complete solution is detailed with respect to the design principles that have been presented often some
classical errors are pointed out Roughly speaking two thirds of the book is devoted to the detailed rational construction of the
solutions
