

## ELECTRONIC DEVICES AND CIRCUITS

### Two marks Question and answers

#### **UNIT -I**

**1. What are conductors? Give examples?**

Conductors are materials in which the valence and conduction band overlap each other so there is a swift movement of electrons which leads to conduction. Ex. Copper, silver.

**2. What are insulators? Give examples?**

Insulators are materials in which the valence and conduction band are far away from each other. So no movement of free electrons and thus no conduction. Ex glass, plastic.

**3. What are Semiconductors? Give examples?**

The materials whose electrical property lies between those of conductors and insulators are known as Semiconductors. Ex germanium, silicon.

**4. What are the types of Semiconductor?**

1. Intrinsic semiconductor
2. Extrinsic semiconductor.

**5. What is Intrinsic Semiconductor?**

Pure form of semiconductors are said to be intrinsic semiconductor.

Ex: germanium, silicon

**6. What is Extrinsic Semiconductor?**

If certain amount of impurity atom is added to intrinsic semiconductor the resulting semiconductor is Extrinsic or impure Semiconductor.

**7. What are the types of Extrinsic Semiconductor?**

1. P-type Semiconductor
2. N-Type Semiconductor.

**8. What is P-type Semiconductor?**

The Semiconductor which are obtained by introducing pentavalent impurity atom (phosphorous, antimony) are known as P-type Semiconductor.

**9. What is N-type Semiconductor?**

The Semiconductor which is obtained by introducing trivalent impurity atom (gallium, indium) are known as N-type Semiconductor.

**10. What is doping?**

Process of adding impurity to a intrinsic semiconductor atom is doping. The impurity is called dopant.

**11. Define drift current.**

When an electric field is applied across the semiconductor, the holes move towards the negative terminal of the battery and electron move towards the positive terminal of the battery. This drift movement of charge carriers will result in a current termed as drift current.

**12. Give the expression for drift current density due to electron.**

$$J_n = q n \mu_n E$$

A. Benson, 1976-11-11 Many changes have been made in this edition first to the nomenclature so that the book is in agreement with the International System of Units S I and secondly to the circuit diagrams so that they conform to B S S 3939 The book has been enlarged and now has 546 problems Much more emphasis has been given to semiconductor devices and transistor circuits additional topics and references for further reading have been introduced some of the original problems and solutions have been taken out and several minor modifications and corrections have been made It could be argued that thermionic valve circuits should not have been mentioned since valves are no longer considered important by most electronic designers except possibly for very high power or voltage applications Some of the original problems on valves and valve circuits have been retained however for completeness because the material is still present in many syllabuses and despite the advent and proliferation of solid state devices in recent years the good old fashioned valve looks like being in existence for a long time There are still some topics readers may expect to find included which have had to be omitted others have had less space devoted to them than one would have liked A new feature of this edition is that some problems with answers given at the end of each chapter are left as student exercises so the solutions are not included The author wishes to thank his colleagues Professor P N **Electronic Devices and Circuits**
