

Atomic Probing Structure of the Atom

Name _____
Date _____

Purpose:

To determine the structure of the atom by observing the deflection of alpha particles.

Part I: Finding Evidence for Atomic Structure

Alpha particles are positively charged particles with a mass of approximately 4 atomic mass units. They are emitted from the nucleus of a radioactive substance. In this experiment, alpha particles are directed at a thin foil of gold. The deflection of the particles is observed and recorded.

Observation: The alpha particles are deflected at various angles, indicating a non-uniform distribution of mass in the atom.

These observations suggest that the atom is not a uniform sphere, but has a central region of high density.

Conclusion: The alpha particles are deflected by the central region of the atom, which is the nucleus. This suggests that the nucleus is a small, dense region of positive charge.

These observations suggest that the atom is not a uniform sphere, but has a central region of high density.

Observation: The alpha particles are deflected at various angles, indicating a non-uniform distribution of mass in the atom.

These observations suggest that the atom is not a uniform sphere, but has a central region of high density.
