In Detail This book will introduce you to the key mathematical models used to price financial derivatives as well as the implementation of main numerical models used to solve them. In particular, equity, currency, interest rates and credit derivatives are discussed. In the first part of the book, the main mathematical models used in the world of financial derivatives are discussed. Next, the numerical methods used to solve the mathematical models are presented. Finally, both the mathematical models and the numerical methods are used to solve some concrete problems in equity, forex, interest rate and credit derivatives. The models used include the Black Scholes and Garman Kohlhagen models, the LIBOR market model, structural and intensity credit models. The numerical methods described are Monte Carlo simulation for single and multiple assets, Binomial Trees and Finite Difference Methods. You will find implementation of concrete problems including European Call, Equity Basket, Currency European Call, FX Barrier Option, Interest Rate Swap, Bankruptcy and Credit Default Swap in C. What you will learn from this book: Solve complex pricing problems in financial derivatives using a structured approach with the Bento Box template. Explore some key numerical methods including binomial trees, finite differences and Monte Carlo simulation. Develop your understanding of equity, forex, interest rate and credit derivatives through concrete examples. Implement simple and complex derivative instruments in C. Discover the most important mathematical models used in quantitative finance today to price derivative instruments. Effectively incorporate object oriented programming (OOP) principles into the code.
