• Research to be done will investigate epigenetically mediated, non-coding DNA changes and their relationship with disease.

• However, Progress in this area has been slow, perhaps due to a lack of appreciation for the complexity and specificity of the epigenetic changes and their relationship with disease.

• Progress in epigenetics will also be influenced by the development of new technologies. These include:

- Recently developed technologies have enabled us to map changes and responses of the body to a particular treatment or environmental factor.
- These include: microarray technology, proteomic analysis, metabolomic analysis, and genomic analysis.
- These technologies will help us to better understand the disease process, and provide diagnostic and therapeutic tools to better manage disease.

• However, as mentioned, we must be careful not to jump to conclusions, as there are many other factors that contribute to disease, and these may be influenced by epigenetic changes. These include: genetic, epigenetic, environmental, and social factors.

• The following table summarizes some epigenetic processes that have been identified, along with their mechanisms, along with some clinical applications.

Epigenetic Process	Mechanism	Clinical Application
Gene silencing	methylation of DNA, histone modifications, and chromatin remodeling	Anticancer drugs, gene therapy
Gene activation	removal of methylation, histone modifications, and chromatin remodeling	Gene therapy, gene delivery
Gene regulation	methylation of DNA, histone modifications, and chromatin remodeling	Anticancer drugs, gene therapy
Gene expression	methylation of DNA, histone modifications, and chromatin remodeling	Gene therapy, gene delivery

• These technologies, and biological knowledge, will help us to better understand disease, and provide diagnostic and therapeutic tools to better manage disease.

• However, we must be careful not to jump to conclusions, as there are many other factors that contribute to disease, and these may be influenced by epigenetic changes. These include: genetic, epigenetic, environmental, and social factors.

Consequently, researchers usually try to prove that the theory is correct by conducting experiments. These tests for consistency, however, are usually repeated indefinitely, and a confirmation of a theory.

As compared to the new approach, the current scheme can only reduce errors. It does not increase the detection probability. Thus, a very reasonable compromise is to implement a hybrid approach (i.e., the current scheme for detection and the new approach for error reduction).
