Current Views of Hypothalamic Contributions to the Control of Motivated Behaviors Joel D. Hahn, George Fink, Menno R. Kruk, B. Glenn Stanley, 2019-11-27 The increasing availability of technologies for interrogating genetically targeted neurons is driving a resurgence of empirical research aimed at determining the structure and function of the neural systems that control motivated behaviors. This has refocused attention on the hypothalamus whose central role in behavioral control was identified about a century ago. As a result, new insights into hypothalamic contributions to the control of motivated behaviors are emerging, driven not only by the application of new technologies but also by the application in parallel of iteratively refined established techniques and increasingly by informatics approaches applied to maturing neuroscience databases. With this renewed interest in decrypting hypothalamic contributions to the control of motivated behaviors, it is timely to provide an updated overview that bridges current insights and historical foundations.

Trace Fossils William Miller III, 2011-10-13 This book serves as an up to date introduction as well as overview to modern trace fossil research and covers nearly all of the essential aspects of modern ichnology. Divided into three sections, Trace Fossils covers the historical background and concepts of ichnology, on-going research problems and indications about the possible future growth of the discipline and potential connections to other fields. This work is intended for a broad audience of geological and biological scientists. Workers new to the field could get a sense of the main concepts of ichnology and a clear idea of how trace fossil research is conducted. Scientists in related disciplines could find potential uses for trace fossils in their fields. And established workers could use the book to check on the progress of their particular brand of ichnology. By design, there is something here for novice and veteran, insider and outsider, and for the biologically oriented workers and for the sedimentary geologists. Presents a review of the state of ichnology at the beginning of the 21st Century. Summarizes the basic concepts and methods of modern trace fossil research. Discusses crucial background information about the history of trace fossil research, the main concepts of ichnology, examples of current problems and future directions and the potential connections to other disciplines within both biology and geology.

The Wire, 2006 **Beavers** Frank Rosell, Róisín Campbell-Palmer, 2022 Over the last 20 years there has been a huge increase in the number of scientific papers published on these remarkable creatures and an authoritative synthesis is now timely. This accessible text goes beyond their natural history to describe the impacts on humans, conflict mitigation, animal husbandry, management and conservation.

Large-scale dam removal and ecosystem restoration Rebecca McCaffery, Laura Soissons, Jeffrey J. Duda, Jean-Marc Roussel, 2024-09-20 Rivers are vital ecosystems that support aquatic and terrestrial biodiversity and several ecosystem services including food, water, culture and recreation. After centuries of building dams on rivers across the world, dam removal projects are now on the rise due to obsolescence, reservoir sedimentation, insufficient return on investment or river restoration and conservation priorities. Most dam removal projects have focused on smaller structures (10 m in structural height) but larger structures have also started to be removed in increasing numbers as

practitioners river managers conservationists and the public have gained more experience with the practice Recent estimates suggest that only a small fraction of dam removals have been scientifically studied and include mostly small dams and short time scales Documenting the long term ecological outcomes of large dam removal i e 10 m tall represents a new frontier in dam removal research projects are more recent and provide an opportunity to understand the complex ecological changes that occur with these transformative restoration projects Here we aim to collate a diverse array of papers on long term dam removal research projects involving larger dams 10 m to synthesize the issues outcomes tools and experimental designs used to study large dam removal projects from physical biological and ecological perspectives With this collection we aim to showcase diverse global projects on ecosystem responses to large dam removal collect perspectives from different disciplines fields and geographies and synthesize the current state of knowledge in this area We expect that this Research Topic will be informative to ongoing long term ecological restoration and monitoring projects related to dam removal as well as to upcoming large dam removal projects We welcome contributions from all disciplines addressing the physical ecological and ecosystem responses to large scale dam removal Contributions could include original research in a specific discipline or area case studies or synthesis papers that address one or more of these topics in a transdisciplinary approach Contributors could address any of the following major topics as related to outcomes of large dam removal alone or in combination Freshwater estuarine and marine aquatic biota River and reservoir geomorphology Terrestrial and riparian vegetation Wildlife Sedimentation and Modelling We would like contributors to highlight key results in their area of study cross disciplinary insights and lessons learned that could inform ongoing monitoring and research efforts in current projects as well as upcoming large dam removals

Learning and Memory Randolph Menzel,Paul Benjamin,2013-06-18 Understanding how memories are induced and maintained is one of the major outstanding questions in modern neuroscience This is difficult to address in the mammalian brain due to its enormous complexity and invertebrates offer major advantages for learning and memory studies because of their relative simplicity Many important discoveries made in invertebrates have been found to be generally applicable to higher organisms and the overarching theme of the proposed will be to integrate information from different levels of neural organization to help generate a complete account of learning and memory Edited by two leaders in the field Invertebrate Learning and Memory will offer a current and comprehensive review with chapters authored by experts in each topic The volume will take a multidisciplinary approach exploring behavioral cellular genetic molecular and computational investigations of memory Coverage will include comparative cognition at the behavioral and mechanistic level developments in concepts and methodologies that will underlie future advancements and mechanistic examples from the most important vertebrate systems nematodes molluscs and insects Neuroscience researchers and graduate students with an interest in the neural control of cognitive behavior will benefit as will as will those in the field of invertebrate learning Presents an overview

of invertebrate studies at the molecular cellular neural levels and correlates findings to mammalian behavioral investigations Linking multidisciplinary approaches allows for full understanding of how molecular changes in neurons and circuits underpin behavioral plasticity Edited work with chapters authored by leaders in the field around the globe the broadest most expert coverage available Comprehensive coverage synthesizes widely dispersed research serving as one stop shopping for comparative learning and memory researchers **Mathematical Reviews** ,2006 *Interactions between the mammalian main and accessory olfactory systems* Jorge A Larriva-Sahd,Micheal Baum,2015-01-05 The functional cross talk and structural interaction between the main and accessory olfactory bulb is a central problem in mammalian sensory neurobiology The early supposition that volatile substances and pheromones most of them hydro-soluble molecules are exclusively sensed and decoded by the main MOS and accessory olfactory systems AOS respectively needs to be revised In fact a large number of structural and functional evidences accumulated during the last few decades suggests that rather than separated entities the MOS and AOS act synergically bringing about physiological and behavioural responses The goal of the present Research Topic will be to gather original research studies and revision papers performed by the most authoritative research groups that have recently contributed to the broad area of sensory neurobiology Special attention should be given to contributions addressed to the MOB and AOB cross talk involving current neuroanatomical techniques *Environmental Constraints Upon Locomotion and Predator-prey Interactions in Aquatic Organisms* Paolo Domenici,Ricard V.
