Ecology of Coastal Marine Sediments Simon Thrush, Judi Hewitt, Conrad Pilditch, Alf Norkko, 2021 This accessible textbook provides an ideal point of entry into the field providing basic information on the nature of soft sediment ecosystems examples of how and why we research them the new questions these studies inspire and the applications that ultimately benefit society

The Coevolution of IDO1 and AhR in the Emergence of Regulatory T Cells in Mammals Ursula Grohmann, Paolo Puccetti, 2016-01-28 Indoleamine 2,3 dioxygenase IDO1 is an ancestral enzyme that initially confined to the regulation of tryptophan availability in local tissue microenvironments is now considered to play a wider role that extends to homeostasis and plasticity of the immune system. Thus IDO biology has implications for many aspects of immunopathology including viral infections, neoplasia, autoimmunity and chronic inflammation. Its immunoregulatory effects are mainly mediated by dendritic cells (DCs) and involve not only tryptophan deprivation but also production of kynurenines that act on IDO1 DCs thus rendering an otherwise stimulatory DC capable of regulatory effects as well as on T cells. The aryl hydrocarbon receptor AhR is a ligand operated transcription factor originally recognized as the effector mediating the pathologic effects of dioxins and other pollutants. However, it is now well established that AhR activation by endogenous ligands can produce immunoregulatory effects. The IDO1 mechanism appears to have been selected through phylogenesis primarily to prevent overreacting responses to TLR recognized pathogen associated molecular patterns and only later did it become involved in the response to T cell receptor recognized antigens. As a result in mammals IDO1 has become pivotal in fetomaternal tolerance at a time when regulatory T cells emerged to meet the same need namely protecting the fetus. IDO1 and regulatory T (Treg) cells may have then coevolved to broaden their function well beyond their initial task of protecting the fetus such that in acquired immunity IDO1 with its dual enzymic and signaling function has turned into an important component of the peripheral generation and effector function of regulatory T cells. AhR in turn which has a role in regulatory T cell generation is presumed to have evolved from invertebrates where it served a ligand independent role in normal development processes. Evolution of the receptor in vertebrates resulted in the ability to bind structurally different ligands including xenobiotics and microbiota derived catabolites. Considering the inability of invertebrate AhR homologs to bind dioxins the adaptive role of the AhR to act as a regulator of xenobiotic metabolizing enzymes may have been a vertebrate innovation to later acquire an additional immune regulatory role by coevolutionary pressure in mammals by IDO1 and regulatory T cells. Thus an entirely new paradigm in immunology and more specifically in immune tolerance is the coevolution of three systems namely the IDO1 mechanism, AhR driven gene transcription and T cell regulatory activity that originating from the initial need of protecting the fetus in mammals have later turned into a pivotal mechanism of peripheral tolerance in autoimmunity, transplantation and neoplasia.
