Jeffries,2012-12-06 In mathematics there are limits speed limits of a sort on how many computational steps are required to solve certain problems The theory of computational complexity deals with such limits in particular whether solving an n dimensional version of a particular problem can be accomplished with say 2^n steps or will inevitably require 2^n steps Such a bound together with a physical limit on computational speed in a machine could be used to establish a speed limit for a particular problem But there is nothing in the theory of computational complexity which precludes the possibility of constructing analog devices that solve such problems faster It is a general goal of neural network researchers to circumvent the inherent limits of serial computation As an example of an n dimensional problem one might wish to order n distinct numbers between 0 and 1 One could simply write all n ways to list the numbers and test each list for the increasing property There are much more efficient ways to solve this problem in fact the number of steps required by the best sorting algorithm applied to this problem is proportional to $n \ln n$ In Uniform Trade List Annual ,1977
