Audio-Visual Integration in Smooth Pursuit Eye Movements Christian Wolf, 2014-11-26 Christian Wolf shows that even with unreliable visual information no auditory motion is integrated to guide smooth pursuit eye movements. This suggests that smooth pursuit eye movements are solely driven by visual motion information and motion information from other senses is disregarded.

Multi-sensory Integration in Motion Perception Clayton D. Rothwell, 2014 Previous experiments have attempted to measure smooth pursuit eye movements (SPEM) to acoustic targets with limited success. Some studies found no evidence for SPEM (Gauthier and Hofferer 1967, Schaefer et al 1981, Boucher et al 2004, Berryhill et al 2006) and other studies found only a sub set of subjects could produce SPEM which was poor in quality (Krukowski et al 2001, Hashiba et al 1996, Cloninger et al 2013, 2014). These findings are despite evidence of auditory motion perception and an auditory motion aftereffect in the psychoacoustic literature (Carlile and Best 2002, Dong et al 2000). This thesis explored a multi modal question: whether sounds can facilitate or interfere with pursuit of a visual target by moving congruent with or incongruent with linear visual motion and did so using high fidelity eye tracking that allowed for examination of the main pursuit characteristics: latency, open loop acceleration, open loop peak acceleration, steady state gain, i.e. eye velocity/target velocity and number of catch up saccades. Results showed evidence of facilitation in some characteristics (open loop peak acceleration) but no evidence of interference, possibly due to the strength of the visual stimulus.

**Visual Signals for Smooth Pursuit Eye Movements** Miriam Sperling, 2006

**Eye Tracking Methodology: Theory and Practice** Andrew Duchowski, 2013-03-14 The scope of the book falls within a fairly narrow Human Computer Interaction domain, i.e. describing a particular input modality; however, it spans a broad range of interdisciplinary research and application topics. There are at least three domains that stand to benefit from eye tracking research: visual perception, human computer interaction and computer graphics. The amalgamation of these topics forms a symbiotic relationship. Graphical techniques provide a means of generating rich sets of visual stimuli ranging from 2D imagery to 3D immersive virtual worlds, while research exploring visual attention and perception in turn influences the generation of artificial scenes and worlds. Applications derived from these disciplines create a powerful Human Computer Interaction modality, namely interaction based on knowledge of the user's gaze. Recent advancements in eye

tracking technology specifically the availability of cheaper faster more accurate and easier to use trackers have inspired in creased eye movement and eye tracking research efforts However although eye trackers offer a uniquely objective view of overt human visual and atten tional processes eye trackers have not yet gained widespread use beyond work conducted at various research laboratories This lack of acceptance is due in part to two reasons first the use of an eye tracker in an applied experimen tal setting is not a widely taught subject Hence there is a need for a book that may help in providing training

**Eye Movements** Dennis F. Fisher, Richard A. Monty, John W. Senders, 2017-03-27 Originally published in 1981 this volume represents the edited proceedings of the third symposium on eye movements and behaviour sponsored by the US Army Human Engineering Laboratory The conference titled The Last Whole Earth Eye Movement Conference was held in Florida in February 1980 As the conference approached seizure of the American hostages by the Iranian militants the Russian invasion of Afghanistan and the uncertain economic outlook around the world made it appear as though the title was a self fulfilling prophecy But the meeting proved highly successful and people throughout the world seemed to be adapting to the stresses of international tension making the possibility of subsequent meetings more likely The present volume is intended to serve as a complementary text to the earlier texts Eye Movements and Psychological Processes Monty Senders 1976 and Eye Movements and the Higher Psychological Functions Senders Fisher Monty 1978 rather than a revision and update of them

**Context- and Experience-dependent Modulation of the Sensorimotor Transformation for Smooth Pursuit Eye Movements** Megan Rose Carey, 2005 Smooth pursuit eye movements work in combination with other eye movement systems to ensure stable vision in a non stationary world Pursuit eye movements are tracking eye movements that allow primates to keep moving objects stable on the retina for improved visual processing Although the basic task of the pursuit system is to perform a sensorimotor transformation that generates an eye velocity that matches target velocity the relationship between target motion and subsequent eye movement is not fixed This thesis investigates the neural signals that modulate the sensorimotor transformation for pursuit based both on current context and on previous experience The amplitude of the pursuit response to a brief perturbation of target velocity is larger if the perturbation is presented during ongoing pursuit vs during fixation To understand the neural signals used by the pursuit system to control the gain of the response to target perturbations under different initial conditions and thereby constrain the possible sites and mechanisms of context dependent pursuit modulation I used passive whole body rotation to distinguish between eye velocity eye in head and gaze velocity eye in world signals Adaptive modification of the vestibulo ocular reflex allowed a further distinction between gaze velocity per se and the visually driven component of gaze velocity The results demonstrate that signals intermediate to gaze velocity and visually driven gaze velocity control context dependent modulation of pursuit In a separate set of experiments I investigated the signals that modulate the sensorimotor transformation for pursuit based on experience Specifically I used microstimulation in cortical

area MT to test the hypothesis that visual motion signals represented there could provide instructive signals for pursuit learning. The results demonstrate that activity in MT consistently associated with pursuit in a given direction is sufficient to drive learning for pursuit. Additional experiments stabilizing the target on the retina and using motion of a visual background to mimic MT stimulation demonstrate that visual signals in general including target motion relative to the eye and activity in MT provide powerful instructive signals for pursuit learning under physiological conditions.

Over the last several decades significant progress has been made in understanding how primates use vision to guide reaches. Visually guided reaching is complicated by the fact that primates make continuous eye movements causing visual information to shift multiple times a second. It is still poorly understood how the brain accounts for these visual shifts and maintains the spatial stability of visually guided reaching. Building upon the current science this thesis presents new studies that advance our understanding of the neural mechanisms underlying visually guided reaching. Visual information is perturbed by many types of motion from the translation of the body through space to head movements to fast saccadic eye movements. In particular it is not well understood how the brain accounts for slower tracking eye movements called smooth pursuits. We found that both smooth pursuit and the more common saccadic eye movements have equivalent effects on the neural substrates of visually guided reaching. This result suggests that the brain compensates for changes to visual information similarly even if the mechanism that moves the eyes is different. Given that smooth pursuits can last many seconds the time course of compensation for changes to visual information during the pursuit is unclear. We found that neural reach activity in the cortex changes continuously throughout the pursuit. This is the first finding that cortical reach neurons update continuously and it implies that there are mechanisms to compensate for slow changes to vision that could potentially operate under other conditions like walking and head movements. Finally what signals does the brain use to account for eye movements. By manipulating the predictability of pursuits using visual feedback about their endpoint we found that predictable eye movements were better compensated for than unpredictable eye movements. Many studies note the importance of feedforward signals related to the eye movement command. Our finding reinforces the view that the brain compensates for shifts to visual information by combining both feedback and feedforward signals.

*The Mind's Eye* Ralph Radach, Jukka Hyona, Heiner Deubel, 2003-06-05

The book provides a comprehensive state of the art overview of current research on cognitive and applied aspects of eye movements. The contents include peer reviewed chapters based on a selection of papers presented at the 11th European Conference on Eye Movements, Turku, Finland, 2001, supplemented by invited contributions. The ECEM conference

series brings together researchers from various disciplines with an interest to use eye tracking to study perceptual and higher order cognitive functions The contents of the book faithfully reflect the scope and diversity of interest in eye tracking as a fruitful tool both in basic and applied research It consists of five sections visual information processing and saccadic eye movements empirical studies of reading and language production computational models of eye movements in reading eye tracking as a tool to study human computer interaction and eye movement applications in media and communication research Each section is concluded by a commentary chapter by one of the leading authorities in the field These commentaries discuss and integrate the contributions in the section and provide an expert view on the most significant present and future developments in the respective areas The book is a reference volume including a large body of new empirical work but also principal theoretical viewpoints of leading research groups in the field

**Eye Movements and Sway Velocity** Rebecca L. Haugen, Larissa E. Rousu, 1998      Looking and Acting Michael Land, Benjamin Tatler, 2009-07-30

The human visual system is amazing in its ability to guide us in a diverse range of everyday tasks driving preparing food reading in addition to leisurely pursuits such as ball games or reading music Somehow without conscious effort our eyes find the information we need to negotiate the world around us Only recently however has it become possible to explore just how it is that our eyes can supply the brain systems controlling our limbs with the information they need to carry out these tasks Thanks to the development of head mounted eye trackers we can now explore the strategies that the eye movement system uses in the the initiation and guidance of action Looking and Acting explores a wide variety of visually guided activities from sedentary activities such as reading music or drawing to dynamic behaviours such as driving or playing cricket It proposes that the eye movement system has its own store of knowledge about where to find the most appropriate information for guiding action information not often available to conscious scrutiny Thus every action has its own specific repertoire of linked eye movements The book starts with a brief background of eye movement studies Part two reviews observations and analyses of different activities Finally the book looks at visual representations the neurophysiology of the brain systems involved and the roles of attention and learning Opening up a whole new field in eye movement research the fascinating new book will be of great interest to all vision scientists psychologists physiologists ophthalmologists whether at professional graduate or advanced undergraduate levels

The Application of Smooth Pursuit Eye Movement Analysis to Clinical Medicine, 1994 We analyzed pursuit tracking eye movements from selected neurological patients and compared them to the responses of 20 normal subjects The patients subjects tracked a small spot of light moving sinusoidally in the horizontal plane at a frequency of 0.4 Hz and a peak to peak amplitude of 40 The eye movement responses were separated into a smooth pursuit component and a saccadic component We calculated the asymmetry as well as the gain and phase response of the smooth pursuit component The saccadic component was quantified by calculating the percentage of the total tracking movement contributed by the saccadic system The patients with smooth pursuit impairment exhibited a higher percentage of saccadic tracking and

a lower smooth pursuit gain compared to the normal subjects one patient with a unilateral lesion exhibited significant asymmetry in the smooth pursuit component In this case the direction of the asymmetry indicated the side of the lesion Eye movements Smooth pursuit tracking Ocular tracking saccades
