Data Mining Krzysztof J. Cios, Witold Pedrycz, Roman W. Swiniarski, Lukasz Andrzej Kurgan, 2007-10-05 If you torture the data long enough Nature will confess said 1991 Nobel winning economist Ronald Coase The statement is still true However achieving this lofty goal is not easy First long enough may in practice be too long in many applications and thus unacceptable Second to get confession from large data sets one needs to use state of the art torturing tools Third Nature is very stubborn not yielding easily or unwilling to reveal its secrets at all Fortunately while being aware of the above facts the reader a data miner will find several efficient data mining tools described in this excellent book The book discusses various issues connecting the whole spectrum of approaches methods techniques and algorithms falling under the umbrella of data mining It starts with data understanding and preprocessing then goes through a set of methods for supervised and unsupervised learning and concludes with model assessment data security and privacy issues It is this specific approach of using the knowledge discovery process that makes this book a rare one indeed and thus an indispensable addition to many other books on data mining To be more precise this is a book on knowledge discovery from data As for the data sets the easy to make statement is that there is no part of modern human activity left untouched by both the need and the desire to collect data The consequence of such a state of affairs is obvious

Association Rule Mining Using Vertical Apriori Bassel H. Dhaini, 2004 The aim of data mining as a scientific research is developing methods to analyze large amounts of data in order to discover interesting regularities or exceptions Typical problems which should be resolved during developing effective data mining algorithms arise from the large sizes of both The data sets used in the data mining process and the patterns results sets for example in rules which form discovered knowledge Scientific researchers are oriented to find the most advantageous i e most effective solutions both during the data preparation stage and exploration and finally post processing to obtain results During mining of association rules the main effort has been put so far in developing more and more sophisticated mining algorithms finding interesting patterns in the appropriately prepared data One problem that still needs to be tackled is the problem of excessive Database scans Most of Association rules algorithms are extensions or derivatives of the Apriori algorithm so mostly all of them use the technique of scanning the Database many times in order to obtain the association rules this process lot of Database Scans is very time consuming In this thesis we develop an optimization of the Apriori algorithm namely Vertical Apriori using the C bitset data structure an optimized version of bit vectors Performance improvements will be demonstrated through our experiments section in chapter 6

Association Rule Mining Visualization Bindu Madhavi K.

Khambam,2015 Association rule mining algorithms are the fundamentals for a data mining course Association rule mining helps to extract useful information from the data for various applications such as market analysis Association rules are used for finding frequent items set associations correlations or causal structures among sets of items or object Generally the students find it difficult to understand these key concepts because it requires abstract thinking In addition conveying a clear explanation of how these processes work is a bit of a challenge for the instructors too Since the best way to understand complex algorithms is to see them in action it would be very helpful if a visualization tool of these algorithms were available to the students to play with Hence the drive to come up with a data mining visualization tool that can animate a few of the most widely used and complex data mining algorithms The objective of the project is to provide an association rule mining tutorial and make the students understand the basic underlying concepts Additionally the tutorial provides visualization tool of these algorithms which will help the students to understand the complex algorithms better and they will be able to test them This project is intended to create an exploration environment in which students can learn through experimentation It is targeted at the students wanting to practice algorithms that are being covered in class as well as instructors wishing to embellish their lectures with an animated interface to help the students An understanding of the underlying mechanics of algorithms is of great importance to students who are taking data mining courses

Using Incremental Updating to Maintain Discovered Association Rules in Large Databases Wassim Ghassan Mukaddam,American University of Beirut. Faculty of Arts and Sciences. Department of Computer Science,2004

Because of its wide applicability in many areas including decision support mar ket strategy and financial forecast data mining has recently attracted tremend ous attention in database research Data mining aims at discovering interesting trends in large databases in order to guide decisions about future activities O ne of the tasks in data mining is discovering association rules Mining associat ion rules Mining association rules was introduced in Agrawal et al 1993 over market basket data to identify the set of items that are most often purchased w ith another set of items For example an association rule may state that 70% o f the customers who bought bread and butter also bought jam Knowledge discovered from a database gives a idea about the current state of t he database only but many applications such as on line services and World Wide Web applications require accurate mining information from data that changes on a regular basis In such cases frequent or occasional updates may change the s tatus of some association rules discovered earlier Running data mining algorith ms from scratch each time there is a change in data is obviously not an effici ent strategy Therefore algorithms using previously discovered association rule s along with new data updates to maintain

discovered rules have been proposed In this thesis we review the algorithms for maintaining discovered associations rules and implement some of them Our thesis proceeds as follows first we review well known algorithms for mining association rules Apriori T hen we review algorithms for maintaining association rules FUP DELTA AFPIM i n the F2 object oriented database system research prototype We test the imple mented algorithms on synthetic data
