

Chapter 4

What are the three parts of the cell theory?

- 1) All living organisms are composed of one or more cells.
- 2) Cells are the smallest units of life.
- 3) New cells come from pre-existing cells by cell division.

What are three important parameters in microscopy? What role does the wavelength of light play in the resolution of an image in a microscope?

- Magnification (ratio between size of an image in a microscope and its actual size), resolution (ability to observe two adjacent objects as distinct from one another/measure of clarity), and contrast (how different one structure looks from another)
- Decreased wavelength will increase the resolution of an image

What are three kinds of illumination used in microscopy?

- Light microscope - uses visible light; limited resolution (0.2 micrometers)
- Electron microscope - uses a beam of electrons (shorter wavelength than visible light); resolution in nanometers (100x better)
- Laser illumination - allows us to excite fluorescently tagged molecules in a specimen

In addition to electron microscopy, what are four types of microscopy?

- Standard/bright field - light is focused with glass lenses; light passes directly thru sample
- Phase contrast - microscope amplifies differences in phase of light transmitted or reflected by sample; improved contrast of denser structures with staining; manipulates pathway of light with phase rings which cuts some illumination; not as bright
- Differential interference contrast - manipulates light pathway; uses optics to improve contrast; good for internal cellular structures
- Fluorescence - uses fluorescently labeled substances; useful for visualizing specific structures; loose resolution because light will scatter

What is the difference between TEM and SEM? What are the advantages of using confocal microscopy over ordinary light or electron microscopy?

- Transmission electron microscopy (TEM) - thin slices stained with heavy metals to prepare; more 2D
 - Can resolve biological images to the nanometer level, as opposed to the best light microscope, because electron beams have much shorter wavelengths than visible light
- Scanning electron microscopy (SEM) - sample coated with heavy metal; more 3D
- TEM = finer and for internal ultrastructure of cells
- Confocal microscopy > light or electron microscopy → allows one to visualize living cells, while the sample preparation for cells for any electron microscopy
