### **Synthetic Biology engineering complexity and refactoring cell**

**capabilities** Pablo Carbonell,Jean Marie François,2015-10-26 One of the key features of biological systems is complexity where the behavior of high level structures is more than the sum of the direct interactions between single components Synthetic Biologists aim to use rational design to build new systems that do not already exist in nature and that exhibit useful biological functions with different levels of complexity One such case is metabolic engineering where with the advent of genetic and protein engineering by supplying cells with chemically synthesized non natural amino acids and sugars as new building blocks it is now becoming feasible to introduce novel physical and chemical functions and properties into biological entities The rules of how complex behaviors arise however are not yet well understood For instance instead of considering cells as inert chassis in which synthetic devices could be easily operated to impart new functions the presence of these systems may impact cell physiology with reported effects on transcription translation metabolic fitness and optimal resource allocation The result of these changes in the chassis may be failure of the synthetic device unexpected or reduced device behavior or perhaps a more permissive environment in which the synthetic device is allowed to function While new efforts have already been made to increase standardization and characterization of biological components in order to have well known parts as building blocks for the construction of more complex devices also new strategies are emerging to better understand the biological dynamics underlying the phenomena we observe For example it has been shown that the features of single biological components i e promoter strength ribosome binding affinity etc change depending on the context where the sequences are allocated Thus new technical approaches have been adopted to preserve single components activity as

genomic insulation or the utilization of prediction algorithms able to take biological context into account There have been noteworthy advances for synthetic biology in clinical technologies biofuel production and pharmaceuticals production also metabolic engineering combined with microbial selection adaptation and fermentation processes allowed to make remarkable progress towards bio products formation such as bioethanol succinate malate and more interestingly heterologous products or even non natural metabolites However despite the many progresses it is still clear that ad hoc trial and error predominates over purely bottom up rational design approaches in the synthetic biology community In this scenario modelling approaches are often used as a descriptive tool rather than for the prediction of complex behaviors The initial confidence on a pure reductionist approach to the biological world has left space to a new and deeper investigation of the complexity of biological processes to gain new insights and broaden the categories of synthetic biology In this Research Topic we host contributions that explore and address two areas of Synthetic Biology at the intersection between rational design and natural complexity 1 the impact of synthetic devices on the host cell or chassis and 2 the impact of context on the synthetic devices Particular attention will be given to the application of these principles to the rewiring of cell metabolism in a bottom up fashion to produce non natural metabolites or chemicals that should eventually serve as a substitute for petrol derived chemicals and on a long term view to provide economical ecological and ethical solutions to today's energetic and societal challenges

#### Nano-(Bio)Catalysis in Lignocellulosic Biomass Valorization Rafael Luque, Christophe

Len, Konstantinos Triantafyllidis, 2019-03-01 The valorization of lignocellulosic biomass in the form of forest and agricultural wastes industrial processing side streams and dedicated energy crops toward chemicals fuels and added value products has become a major research area with increasing exploitation potential The efficient and tailored depolymerization of biomass or its primary structural components hemicellulose cellulose and lignin to platform chemicals i e sugars phenolics furans ketones organic acids etc is highly dependent on the development of novel or modified chemo and bio catalytic processes that take into account the peculiarities and recalcitrance of biomass as feedstock compared for example to petroleum fractions The present Research Topic in Frontiers in Chemistry Section of Green and Sustainable Chemistry entitled Nano bio catalysis in lignocellulosic biomass valorization aims to further contribute to the momentum of research and development in the bio catalytic conversion of biomass by featuring original research papers as well as two review papers authored and reviewed by experts in the field The Research Topic addresses various representative reactions and processes in biomass valorization highlighting the importance of developing novel efficient and stable nano bio catalysts with tailored properties according to the nature of the reactant feedstock and the targeted products

Oriented Guided Inquiry Learning POGIL is a pedagogy that is based on research on how people learn and has been shown to lead to better student outcomes in many contexts and in a variety of academic disciplines Beyond facilitating students mastery of a discipline it promotes vital educational outcomes such as communication skills and critical thinking Its active international community of practitioners provides accessible educational development and support for anyone developing related courses Having started as a process developed by a group of chemistry professors focused on helping their students better grasp the concepts of general chemistry The POGIL Project has grown into a dynamic organization of committed instructors who help each other transform classrooms and improve student success develop curricular materials to assist this process conduct research expanding what is known about learning and teaching and provide professional development and collegiality from elementary teachers to college professors As a pedagogy it has been shown to be effective in a variety of content areas and at different educational levels This is an introduction to the process and the community Every POGIL classroom is different and is a reflection of the uniqueness of the particular context the institution department physical space student body and instructor but follows a common structure in which students work cooperatively in self managed small groups of three or four The group work is focused on activities that are carefully designed and scaffolded to enable students to develop important concepts or to deepen and refine their understanding of those ideas or concepts for themselves based entirely on data provided in class not on prior reading of the textbook or other introduction to the topic The learning environment is structured to support the development of process skills such as teamwork effective communication information processing problem solving and critical thinking The instructor s role is to facilitate the development of student concepts and process skills not to simply deliver content to the students The first part of this book introduces the theoretical and philosophical foundations of POGIL pedagogy and summarizes the literature demonstrating its efficacy The second part of the book focusses on implementing POGIL covering the formation and effective management of student teams offering guidance on the selection and writing of POGIL activities as well as on facilitation teaching large classes and assessment The book concludes with examples of implementation in STEM and non STEM disciplines as well as guidance on how to get started Appendices provide additional resources and information about The POGIL Project

**Proceedings of the Second International Symposium on the Biology of the Sipuncula** Michael J. Boyle,Gisele Y. Kawauchi,2018 In June 1970 a diverse group of scientists attended the International Symposium on the Biology of the Sipuncula and Echiura at the Marine Biological Station in Kotor Yugoslavia Forty two years later in June 2012 an aspiring generation of like minded scientists convened the Second International Symposium on the Biology of the Sipuncula ISBS2 along the banks of the Fort Pierce Inlet to the Indian River Lagoon in Florida USA The primary objective of the second symposium was to collect the world s dedicated sipunculan biologists in one place for a long overdue face to face communication of past present and future research We met our objective This proceedings volume includes a brief summary of workshop discussions and field events

and a compilation of selected research papers presented by an international group of sixteen scientists from twelve nations in attendance at the ISBS2. Herein we highlight molecular developmental morphological ecological and biogeographic diversity of adult and larval sipunculans. And we introduce several of the outstanding research challenges associated with resolving sipunculan interrelationships establishing standard sets of taxonomic characters refining methods for identification of cryptic species reconstructing an evolutionary framework of developmental life history patterns and addressing implications of recent phylogenetic and phylogenomic hypotheses that have relocated the ancient radiation of unsegmented sipunculan body plans within the predominantly segmented Annelida.
