Overview

As is often the case in business, there is a need to complete a non-disclosure agreement to protect the confidentiality of a party. Often, the information that needs to be submitted into an NDA such as the names of the parties involved, addresses, etc. are already known information in a database or may be provided through a web interface. The challenge developers face is that dynamically generating documents with custom data and sending them out for signatures has been a manual process. It often requires custom branded documents to be populated by end-users with data first before they can be sent out for signatures.

APIs Used

- Adobe Document Generation API
- Adobe Document Generation Tagger, a Microsoft Word add-in
- Adobe Sign

End User Scenario

A vendor manager has the information of the vendor he would like to do business with including the name of the contact, the address of the business, as well as the scope of the NDA. The vendor manager goes onto an online web portal to initiate the NDA process. At the click of a button, the data is collected from the database, passed to generate the NDA document, and then sent to Adobe Sign to send for signature.
