

**Problem 167** For any  $K$ , consider the  $K$ -rigid motion of  $K$ -geometry

$$M_\theta = \begin{bmatrix} \cos \theta & -\sin \theta & 0 \\ \sin \theta & \cos \theta & 0 \\ 0 & 0 & 1 \end{bmatrix}.$$

Convert this to a rigid motion in central projection.

Generalized Polygons Hendrik, van Maldeghem, 2013-11-09 This book is intended to be an introduction to the fascinating theory of generalized polygons for both the graduate student and the specialized researcher in the field It gathers together a lot of basic properties some of which are usually referred to in research papers as belonging to folklore and very recent and sometimes deep results I have chosen a fairly strict geometrical approach which requires some knowledge of basic projective geometry Yet it enables one to prove some typically group theoretical results such as the determination of the automorphism groups of certain Moufang polygons As such some basic group theoretical knowledge is required of the reader The notion of a generalized polygon is a relatively recent one But it is one of the most important concepts in incidence geometry Generalized polygons are the building bricks of Tits buildings They are the prototypes and precursors of more general geometries such as partial geometries partial quadrangles semi partial geometries near polygons Moore geometries etc The main examples of generalized polygons are the natural geometries associated with groups of Lie type of relative rank 2 This is where group theory comes in and we come to the historical raison d'être of generalized polygons In 1959 Jacques Tits discovered the simple groups of type  $3D$  by classifying the 4 trialitys with at least one absolute point of a  $D$  geometry The method was 4 predominantly geometric and so not surprisingly the corresponding geometries the twisted triality hexagons came into play Generalized hexagons were born
