## AMPLITUDE MODULATION AND DEMODULATION

### 1.1 OBJECTIVE

In this lab, you will learn how to perform the amplitude modulation and demodulation and to calculate the modulation index for various modulating voltages.

### 1.2 HARDWARE REQUIRED

Transistor BC108, Resistors, Capacitors, AFO, CRO, Diode OA79, Multimeter, Regulated power supply, Breadboard and connecting wires.

### 1.3 PREPARATION (PRE-LAB)

Do the complete revision of Amplitude modulation and Demodulation and find the modulation index for the modulating voltage of 6v and given  $V_c$ =60mv,  $f_c$ =500 KHz,  $f_m$ =1KHz.

### 1.4 AMPLITUDE MODULATION

#### 1.4.1 Theory

Modulation is defined as the process by which some characteristics of a carrier signal is varied in accordance with a modulating signal. The base band signal is referred to as the modulating signal and the output of the modulation process is called as the modulation signal.

Amplitude modulation is defined as the process in which the amplitude of the carrier wave is varied about a means values linearly with the base band signal. The envelope of the modulating wave has the same shape as the base band signal provided the following two requirements are satisfied

1. The carrier frequency  $f_c$  must be much greater then the highest frequency components  $f_m$  of the message signal  $m(t)$  i.e.  $f_c \gg f_m$
2. The modulation index must be less than unity. if the modulation index is greater than unity, the carrier wave becomes over modulated.
