

Section 26-1: Introduction to Arthropods

In this section you were introduced to the largest and most diverse animal phylum: the arthropods. You discovered that this group of animals includes horseshoe crabs, spiders, scorpions, ticks, shrimp, barnacles, water fleas, centipedes, millipedes, and butterflies and all other insects, as well as the large group of extinct animals known as trilobites.

You learned that the three main characteristics of an arthropod are tough exoskeleton, a series of jointed appendages, and a segmented body. You learned how arthropods carry out essential life functions, and you studied in detail the body plan of a representative arthropod, the grasshopper.

You discovered that growth and development in arthropods is associated with the process called molting. Arthropods molt, or shed, their exoskeletons in order to grow larger. Some arthropods also change in form as well as in size when they molt. Some arthropods, such as butterflies and beetles, change abruptly and dramatically as they go from one stage of development to the next.

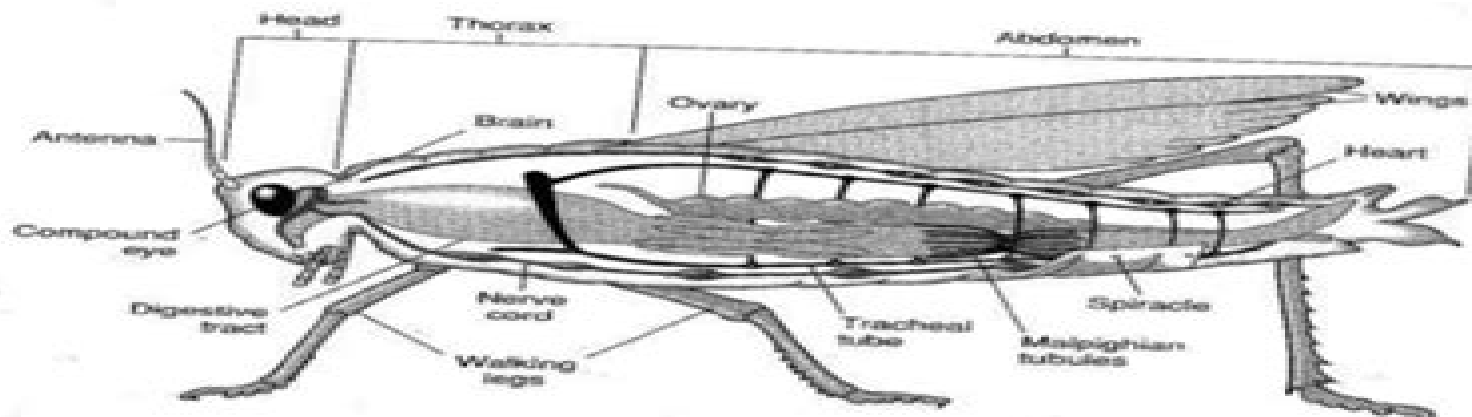

Relating terms: building vocabulary skills

Consider the following terms: exoskeleton, chitin, and molt. In the space provided, write a brief paragraph in which you discuss how these terms are related to one another and explain the importance of these terms in identifying arthropods.

Answers will vary; here is one possible answer: One of the main characteristics of an arthropod is the presence of a tough exoskeleton made of the protein chitin. Arthropods must replace their exoskeleton as they grow and mature. IN order to do this, they molt, or shed, their outgrown exoskeleton. The arthropod then expands to a larger size, and its new, soft exoskeleton, which was secreted by the epidermis inside the old exoskeleton, stretches to cover it.

Interpreting Diagrams: Understanding the Main Ideas

The accompanying diagram shows the internal structures of a representative arthropod, the grasshopper. Refer to the diagram to answer the questions that follow.
