The focus is either on systems including single plants or groups of plants connected or not to one or more energy distribution networks. In both cases the optimum design and operation involve decisions about thermodynamic processes about the type number design parameters of components plants and storage capacities and about mutual interconnections and the interconnections with the distribution grids. The problem is absolutely general encompassing design and operation of energy systems for single houses groups of houses industries industrial districts municipal areas regions and countries. The presented papers show that similar approaches can be used in different applications although a general standard has not been achieved yet
