

## Econometrics I Questions and Answers

### Chapter I

1. Explain the basic econometric data types.
2. Explain "Estimator" and "Estimate".

*Ans:*

*An estimator is a function of a sample of data to be drawn randomly from a population. An estimate is the numerical value of the estimator when it is actually computed using data from a specific sample. An estimator is a random variable because of randomness in selecting the sample, while an estimate is a nonrandom number.*

3. What is wrong with the below model and why is it not accepted econometrically? How do you correct it?

$$Y = \beta_0 + \beta_1 X$$

*Ans:*

*The model shown above is an exact or deterministic relationship between dependent variable  $Y$  and the independent variable  $X$ . That is,  $Y$  is always affected by the variable  $X$ . This contradicts the relationship between economic variables which is generally inexact.  $Y$  cannot always be predicted or explained by  $X$ . There are other variables which explain  $Y$  in addition to  $X$ .*

*To allow for the inexact relationships between economic variables, a disturbance or error term should be added which represents all the other variables which affect  $Y$  in addition to  $X$  but are not taken into account explicitly. That is, the model is corrected as;*

$$Y = \beta_0 + \beta_1 X + u$$

4. For the linear regression shown below, what is the formula for:

a.  $\beta_0$
