

ANSWERS FOR AIR CONDITIONING QUIZ

Q-1: What is air conditioning?

ANS: Air conditioning is the process of controlling the Temperature, Humidity, cleanliness distribution of air in an enclosed area known as a conditioned space. **Comfort Air-Conditioning** refers to systems that maintain the human comfort in an occupied space. Most comfort air conditioning systems use **mechanical refrigeration** to cool and **dehumidify air**. simply define, refrigeration is cooling by removing heat from a substance and transferring that heat to a place where it can be rejected. Such as the **outdoor air**. in a direct expansion or DX System heat is transferred from an indoor unit to the refrigerant. in an indirect heat transfer system refrigerant is used to chill the water, and the heat is transferred from the indoor air to the chilled water.

Q-2: How many types of units we are using to change the condition of Air?

ANS: 1-**DX Systems** 2-**IDX systems**
in **DX systems** we are using Window A/C, Split A/C, and Package units.
in **IDX systems** we are using AHU and FCU to condition the air.

Q-3: What is suitable temperature for human body?

ANS: 70 to 74 deg F is a suitable temperature for human body, and 35% to 50% humidity.

Q-4: How the Air is getting cool by an Air conditioning machine? describe fully.

ANS: In a cooling machine (Indoor unit) of DX system we are getting cool air by refrigerant, this refrigerant is circulating in cooling coil from Throttle to the outlet of evaporator while traveling this refrigerant through cooling coil it is transferring heat, when it is entering to the cooling coil it has very low temperature, when it is traveling from cooling coil it is getting hot because it is taking heat from the room or from the conditioned space by air. the refrigerant is boiling in evaporator from 8 to 12 deg F more than its boiling point. (super heat Range)
EXAMPLE: in a cooling unit Suction Pressure is 68.5psig and suction line temp (closer to the cooling coil outlet line) is 54deg F, we will take the temperature of 68.5psig from pressure temperature chart, that is 40deg F so we will subtract the refrigerant temperature from the suction line temperature, $54 - 40 = 14\text{deg F}$, it is super heat, that refrigerant have taken from the conditioned place or from the water or brine. this super heated refrigerant enters to the compressor, compressor makes difference between suction and discharge pressure it rises the temperature and pressure into the discharge clearance pocket, so this refrigerant enters in the condenser in high pressure high temperature and vapours condition condensers are cooling this refrigerant by water or fans, in this way we remove the heat from refrigerant and reject it to the atmosphere, condenser changes the condition of refrigerant from vapours to the liquid shape.

EXAMPLE: if the liquid line pressure we found 260psig which contains 120deg F temperature and liquid line temperature is 105deg F, so we will subtract the liquid line temperature from the refrigerant temperature, $120 - 105 = 15\text{deg F}$ it is sub-cooled temperature, when this sub-cooled refrigerant enters to the metering device, it will drop the pressure to low and also reduce the temperature. in this process we are getting cool air from DX units. in IDX units the chillers are cooling the water or brine which we circulate to the AHUs and FCUs using a water pump, the water system is calling secondary refrigeration system, as well as compression system is primary refrigeration system.

Note: the heat can not be Destroyed, it can only be transferred from a place to another place.

HEAT TRANSFER: three ways to transfer the heat.

1-**Conduction:** transfer of heat in a metal from one corner to another corner.

2-**Convection:** heat is conducted from flame to water through bottom of vessel.

3-**Radiation:** transfer of heat from a heater by layers of radiation.
