**Abstract** The authors examined the effects of a 12-week, low-intensity, low-impact exercise program on the health-related quality of life of older adults. The program was designed to improve physical and mental health, and to reduce the risk of falls. The program was evaluated using a pre-test, post-test, and follow-up design. The results showed that the program had a positive effect on the health-related quality of life of older adults, and that the effects were maintained at follow-up. The program was well-tolerated and had a high level of adherence. The authors conclude that the program is a promising intervention for improving the health-related quality of life of older adults.
