Electronic Filters Vančo Litovski,2019-11-02 This book provides a comprehensive overview of signal filtering including an introduction definitions of the terms and algorithms for numerical calculation of the properties of the transfer function in frequency and time domains All the chapters discuss the theoretical background and explain the underlying algorithms including the iterative numerical procedures necessary to obtain the solutions It starts by considering polynomial filters offering a broad range of solutions and introducing critical monotonic passband amplitude characteristics CMAC It also describes modifications to the classical Chebyshev and elliptic filters to overcome their limitations In the context linear phase low pass prototypes it presents filters approximating constant group delay in the equi ripple manner for the first time Further it discusses new procedures to improve the selectivity of all polynomial filters by introducing

transmission zeros such as filters with multiple transmission zeros on the omega axis as well as phase correction of selective filters for both low pass and band pass filters Other topics explored include linear phase all pass exhibiting low pass group delay approximation filters all pass filters exhibiting band pass group delay approximation with linear and parabolic phase synthesized directly as band pass high pass and band stop amplitude characteristic frequency transformations to produce band pass and direct synthesis of linear and parabolic phase selective band pass filters synthesized directly as band pass Lastly for system physical synthesis the book describes the algorithms and procedures for the following cascade passive LC active cascade RC active parallel RC for the first time active parallel SC Gm C based on LC prototypes and parallel IIR based on bilinear transformation of analog prototypes Every algorithm be it in transfer function synthesis or in system synthesis is accompanied by a proper nontrivial comprehensive example produced by the RM software
