**Electromagnetic Field Sensors and Clockwork for Quantum Biology and Medicine** Margaret Ahmad ,Brian Crane, 2025-10-03 Cryptochromes are a class of evolutionarily conserved flavoproteins first discovered in plants They were found to function as blue light receptors that mediate multiple aspects of plant growth and development and hence have wide ranging ecological and agricultural significance Cryptochromes were subsequently identified in organisms throughout all biological Kingdoms ranging from prokaryotes such as archaebacteria and blue green algae to eukaryotes including algae fungi invertebrate and vertebrate animal species In mammals they function as central components of the circadian clock and have been linked to medical conditions such as obesity diabetes heart disease inflammation and the onset of certain cancers From a mechanistic perspective cryptochromes are closely evolutionarily related to photolyases a class of light activated DNA repair flavoenzymes which undergo redox reactions Therefore all cryptochromes share important structural and biochemical characteristics Intriguingly recent developments have suggested that cryptochromes may respond to magnetic fields as well as to light and that this property has likewise been conserved among cryptochromes from different organisms As a

consequence cryptochrome photoreceptors are being studied over a vast array of scientific disciplines ranging from plant animal and microbial biology to ecology evolutionary biology and medicine Furthermore numerous studies in the fields of chemistry crystallography biochemistry biophysics mathematics and theoretical physics are probing the underlying mechanisms of how cryptochromes function Much of this work is however only peripherally accessible to cryptochrome researchers outside of their immediate fields of specialization
