(Chapter - 1) (Sexual Reproduction in Flowering Plants)

(Class - XII)

Question 1:

Name the parts of an angiosperm flower in which development of male and female gametophyte take place.

Answer 1:

The male gametophyte or the pollen grain develops inside the pollen chamber of the anther, whereas the female gametophyte (also known as the embryo sac) develops inside the nucellus of the ovule from the functional megasporangium.

Question 2:

Differentiate between microsporogenesis and megasporogenesis. Which type of cell division occurs during these events? Name the structures formed at the end of these two events.

Answer 2:

	Microsporogenesis	Megasporogenesis
1.	It is the process of the formation of microspore tetrads from a microspore mother cell through meiosis.	It is the process of the formation of the four megasporangia from a megasporangium mother cell in the region of the nucellus through meiosis.
2.	It occurs inside the pollen sac of the anther.	It occurs inside the ovule.

Both events (microsporogenesis and megasporogenesis) involve the process of meiosis or reduction division which results in the formation of haploid gametes from the microspore and megasporangium mother cells.

Microsporogenesis results in the formation of haploid microspores from a diploid microspore mother cell. On the other hand, megasporogenesis results in the formation of haploid megasporangia from a diploid megasporangium mother cell.

Question 3:

Arrange the following terms in the correct developmental sequence:

Pollen grain, sporogenous tissue, microspore tetrad, pollen mother cell, male gametes

Answer 3:

The correct development sequence is as follows:

Sporogenous tissue - pollen mother cell - microspore tetrad - Pollen grain - male gamete

During the development of microsporangium, each cell of the sporogenous tissue acts as a pollen mother cell and gives rise to a microspore tetrad, containing four haploid microspores by the process of meiosis (microsporogenesis). As the anther matures, these microspores dissociate and develop into pollen grains. The pollen grains mature and give rise to male gametes.

Question 4:

With a neat, labelled diagram, describe the parts of a typical angiosperm ovule.

Cheminformatics and Bioinformatics at the Interface with Systems Biology Aman Chandra Kaushik,Aamir Mehmood,Dong-Qing Wei,Sadia Nawab,Shakti Sahi,Ajay Kumar,2023-09-08 The cost of drug development is increasing and investment returns are decreasing The number of drugs approved by FDA is in decline in terms of the number of new molecular entities NMEs Amongst the reasons noted for this are the adverse side effects and reduced efficiency of many of the potential compounds This is a problem both for the pharmaceutical industry and for those suffering from diseases for which there are no or few available treatments Advances in computational chemistry computer science structural biology and molecular biology have all contributed to improved drug design strategies and reduced the time taken for drug discovery By interfacing cheminformatics and bioinformatics with systems biology we can create a powerful tool for understanding the mechanisms of patho physiological systems and identifying lead molecules for various diseases This integration of drug design approaches can also play a crucial role in the prediction and rationalization of drug effects and side effects improving safety and efficacy and leading to better approval rates Addressing the lack of knowledge on the fundamental aspects of the various computational tools for drug discovery this book is a compilation of recent bioinformatics and cheminformatics approaches and their integration with systems biology Written primarily for researchers and academics in chem and bioinformatics it may also be a useful resource for advanced level students
