How to Make a Lava Lamp

What Happened

A lava lamp works because of two different scientific principles: density and polarity.

Density is the measurement of how compact a substance is. The denser it is, the more it will sink to the bottom of a jar.

If you mix oil and water, you'll find that the water is heavier than the oil. Water is heavier than oil, so it will sink to the bottom of the jar.

Adding food coloring and water will create a mixture that is heavier than the oil. The water and food coloring are "heavier" because they have a higher density than the oil.

Oil molecules, however, are non-polar. They don't have a positive charge, so they are not attracted to the water molecules at all. This is why oil and water don't mix. Instead of mixing, a light cream is formed. The oil and water will stay separate. The water will sink to the bottom, and the oil will float on top. The water will sink to the bottom, and the oil will float on top. The water will sink to the bottom, and the oil will float on top.
