Led Lighting and Drivers J Marcos Alonso,2019-11-27 The book is organized in four chapters Chapter 1 deals with an introduction to light and lighting As a power electronics engineer working on LEDs and lighting systems in general I think it is important for the reader to have the basic knowledge about lighting systems which I have tried to summarize in this chapter Because of the extremely interesting possibilities of LEDs to generate different light colors Chapter 1 includes a section related to the understanding of color quantification and measurement in different color spaces The Chapter also includes several examples on light and color calculations In order to develop and implement a suitable LED driver it is necessary to have a good knowledge about LED behavior and characteristics Thus Chapter 2 aims at providing the reader with the most important issues related to LED operation and modeling from a practical point of view The most common LED structures and materials are presented in this chapter together with the most relevant electrical thermal and optical characteristics making special emphasis on those characteristics provided by LED manufacturers in their datasheets Special sections are dedicated to light dimming and color mixing The chapter is closed with a brief review of organic LED OLED

technology which is another promising LED technology nowadays Chapter 3 is devoted to DC LED drivers which are those LED drivers intended to supply the LED from a DC voltage source like a battery or a DC bus This chapter covers the three most relevant technologies that are being used to implement DC LED drivers at the present time which are those based on linear regulators switched capacitor regulators and switching regulators The most relevant solutions to implement DC LED drivers are reviewed from a practical point of view The chapter also reviews the most common control methods applied to DC LED drivers Examples are included by means of computer simulations based on LTspice which is a free but powerful SPICE based simulation software developed by former Linear Technologies Company now part of Analog Devices The chapter ends with a section devoted to LED configurations namely series parallel and matrix configurations which are employed to implement high power LED lamps Finally Chapter 4 is dedicated to off line LED drivers This is the denomination given to LED drivers that are intended to operate from an AC grid voltage These are the most complicated LED drivers since they usually require the implementation of a front end power factor correction PFC stage followed by a downstream DC DC converter to adapt voltage levels and provide regulated current to the LED lamp The most important standards and regulations related to this type of LED drivers are presented at the beginning of the chapter Then single stage LED drivers are studied which can be used as a stand alone off line LED driver or as a first stage in a two stage off line LED driver The highly relevant problem of requiring a large storage capacitance in single stage off line LED drivers to cope with the double line frequency pulsating power originated from line voltage rectification is addressed in this chapter Finally integrated two stage off line LED drivers are presented and studied as a solution to reduce the storage capacitance of off line LED drivers aiming at using high reliability film capacitors instead of less reliable electrolytic capacitors LTspice simulation examples are also provided in this chapter to allow the reader to have a better idea about the design and operation of this type of LED drivers

*A Novel Dimmable LED Driver with Soft-start and UVLO Circuits*, 2015      *Topics on Light-emitting-diode Driver Research* Jaber Hasan, 2012 In this dissertation light emitting diode LED drivers are investigated for efficiency issues related to driving Red Green Blue RGB pixels and multiple LED strings in parallel A high efficiency digitally controlled RGB LED driver was designed for driving a 3x3 RGB LED display panel A multiplexer was used to sense the voltage drop across the current controllers This driver maintained a minimum drive voltage across the RGB LED pixels required to keep it in regulation leading to a reduction of unwanted power losses in the RGB LED pixels by selecting the minimum drop across the current controllers as the reference voltage of the digital controller Additionally analog dimming was implemented to dim each individual LED in a 3x3 RGB LED display panel Efficiencies of 85.6 %, 93.3 % and 91.1 % were experimentally obtained for red green and blue LEDs respectively at the rated output current For comparison efficiencies of 38.3% for the red LED 66.2 % for the green LED and 64.5 % for the blue LED at the nominal current of 20mA using a 5 V supply were achieved in conventional LED drivers For parallel connected LED strings a current controller is required for each string to maintain the

desired current with the drive voltage provided by a switch mode power converter SMPC A novel analog digital LED driver controller was designed for driving a two string LED load with three white LEDs in each string for backlight application in liquid crystal displays LCDs In this implementation an analog controller was used to control the output voltage of the SMPC while a digital controller was used to achieve the minimum drive voltage across the output LED strings leading to an efficiency of 89 % at the rated output current A phase shifted pulse width modulation PSPWM dimming was implemented to reduce load stresses improve electromagnetic interferences EMI and increase system efficiency A mathematical model based on multirate simulation technique for merging the analog and digital controllers was proposed Finally a LED driver chip was designed and fabricated using a 0.5 micron CMOS process to reduce size of the overall LED driver system The integrated circuit consisted of a 16 channel analog multiplexers five current controllers and buffer circuits The LED driver chip function was experimentally verified using a SMPC to drive a five string LED load in parallel with a single green LED in each string for display panel applications by maintaining a minimum drive voltage across the LED strings thus leading to an efficiency of 75 % at the rated output current

*Analysis and Implementation of an Electronic Scanning Circuit in a Led Lamp Design for Energy Conservation* Cinthia Guadalupe Benitez Campos, 2010 Since the introduction of the light emitting diode the number of illuminating products that use LEDs has grown at an accelerating pace Due to some features such as high luminous efficiency low energy loss long life safety and eco friendliness white LED lamps are expected to replace conventional lamps If solid state lighting replaced all existing lights the DOE estimates customer savings of 115 billion by 2025 and a 10% reduction in greenhouse emission gases With its overwhelming upsurge white LED driver circuits are also increasingly becoming a focus of research Therefore the purpose of this study was to develop an innovative driving technique for LED luminaries that reduces the consumption of electric power necessary for lighting and thus makes them more efficient This driving technique was based on an electronic scanning method The accomplishment of this objective required designing and constructing an electronic circuit that effectively implements the electronic scanning technique in a LED array as well as developing a method of measurement and evaluation to aid in analyzing the effect of this technique on the human perception of brightness With this new design it was possible to get a LED lamp prototype that is more efficient than the conventional luminaries driven with constant direct current uses less energy and illuminates at the same intensity perceived by the eye

*Universal-Input Single-Stage PFC Flyback LED Driver with Lossless Snubber Circuit* [10], 2010 *A Novel Boost Converter Based LED Driver Chip Targeting Mobile Applications* Ge Wang, 2016 A novel integrated constant current LED driver design on a single chip is developed in this dissertation The entire design consists of two sections The first section is a DC DC switching regulator boost regulator as the frontend power supply the second section is the constant current LED driver system In the first section a pulse width modulated PWM peak current mode boost regulator is utilized The overall boost regulator system and its related sub cells are explained Among them an original error amplifier design a current

sensing circuit and slope compensation circuit are presented In the second section the focus of this dissertation a highly accurate constant current LED driver system design is unveiled The detailed description of this highly accurate LED driver system and its related sub cells are presented A hybrid PWM and linear current modulation scheme to adjust the LED driver output currents is explained The novel design ideas to improve the LED current accuracy and channel to channel output current mismatch are also explained in detail These ideas include a novel LED driver system architecture utilizing 1 a dynamic current mirror structure and 2 a closed loop structure to keep the feedback loop of the LED driver active all the time during both PWM on duty and PWM off duty periods Inside the LED driver structure the driving amplifier with a novel slew rate enhancement circuit to dramatically accelerate its response time is also presented
