*Abstract: With the explosive growth of information sources available on the World Wide Web, it has become increasingly necessary for users to utilize automated tools in find the desired information resources, and to track and analyze their usage patterns. These factors give rise to the necessity of creating serverside and clientside intelligent systems that can effectively mine for knowledge. Web mining can be broadly defined as the discovery and analysis of useful information from the World Wide Web. This describes the automatic search of information resources available online, i.e. Web content mining, and the discovery of user access patterns from Web servers, i.e., Web usage mining. In this paper we present detail statistical formulation and experimental result to show how web mining can be utilized to perform potential customer. Web usability is an important and sometimes controversial research area. We proposed an integrated system for web mining and usability study where four core modules are designed to address the fundamental issues in usability analysis.. As an example to cross modules analysis, we apply association rule mining from the link structure obtained from web mining module to automatically discover menus and structures in a web site.*

*Keywords: web mining, potential customer.*

## 1. INTRODUCTION

With the explosive growth of information sources available on the World Wide Web, it has become increasingly necessary for users to utilize automated tools in order to find, extract, filter, and evaluate the desired information and resources. In addition, with the transformation of the web into the primary tool for electronic commerce, it is imperative for organizations and companies, who

have invested millions in Internet and Intranet technologies, to track and analyze user access patterns. These factors give rise to the necessity of creating server-side and client-side intelligent systems that can effectively mine for knowledge both across the Internet and in particular web localities.
