Android Security Internals In Depth Architecture:

Android Security Internals Nikolay Elenkov, 2014-10-14 There are more than one billion Android devices in use today each one a potential target. Unfortunately many fundamental Android security features have been little more than a black box to all but the most elite security professionals until now. In *Android Security Internals* top Android security expert Nikolay Elenkov takes us under the hood of the Android security system. Elenkov describes Android security architecture from the bottom up, delving into the implementation of major security related components and subsystems like Binder IPC permissions, cryptographic providers and device administration. You'll learn how Android permissions are declared, used and enforced. How Android manages application packages and employs code signing to verify their authenticity. How Android implements the Java Cryptography Architecture (JCA) and Java Secure Socket Extension (JSSE) frameworks. About Android's credential storage system and APIs which let applications store cryptographic keys securely. About the online account management framework and how Google accounts integrate with Android. About the implementation of verified boot, disk encryption, lockscreen and other device security features. How Android's bootloader and recovery OS are used to perform full system updates and how to obtain root access. With its unprecedented level of depth and detail, *Android Security Internals* is a must have for any security minded Android developer.

Design and Analysis of Mobile Operating System Security

Architecture Using Formal Methods Hendra Gunadi, 2017 The Android operating system OS is now used in the majority of mobile devices Hence Android security is an important issue to handle In this work we tackle the problem using two separate approaches directly modifying Android OS and developed a framework to provide a guarantee of non interference Firstly we present a design and an implementation of a security policy specification language based on metric linear time temporal logic MTL to specify timing dependent security policies The design of the language is driven by the problem of runtime monitoring of applications in mobile devices A main case of the study is the privilege escalation attack in the Android OS where an unprivileged app gains access to privileged resource or functionalities through indirect flow To capture these attacks we extend MTL with recursive definitions to express call chains between apps We then show how our language design can be used to specify policies to detect privilege escalation under various fine grained constraints We present a new algorithm for monitoring safety policies written in our specification language The monitor does not need to store the entire history of events generated by the apps We modified the Android OS kernel to allow us to insert our generated monitors modularly We have tested the modified OS LogicDroid on an actual device and show that it is effective in detecting policy violations Furthermore LogicDroid is able to prevent a previously unknown exploit to breach Android security which allows an unprivileged application to access certain critical and privileged functionalities of an Android phone such as making phone calls terminating phone calls and sending SMS without having to ask any permissions to do so Subsequently we provided a

framework to ensure non interference properties of DEX bytecode Each application in Android runs in an instance of the Dalvik virtual machine which is a register based virtual machine VM Most applications for Android are developed using Java compiled to Java bytecode and further into DEX bytecode Following a methodology that has been developed for Java byte code certification by Barthe et al we developed a type based method for certifying non interference property of a DEX program To this end we develop a formal operational semantics of the Dalvik VM a type system for DEX bytecode and prove the soundness of the type system with respect to a notion of non interference We have also formalized the proof of a subset of DEX in Coq for an additional guarantee that our proof is correct We then study the translation process from Java bytecode to DEX bytecode as implemented in the dx tool in the Android SDK We show that an abstracted version of the translation from Java bytecode to DEX bytecode preserves the non interference property More precisely we show that if the Java bytecode is typable in Barthe et al s type system then its translation is typable in our type system This result opens up the possibility to leverage existing bytecode verifiers for Java to certify non interference properties of Android bytecode
