related issues for FPGA s routing and its architectures Routing architecture There are two types of switch modules switch blocks and switch matrices We present techniques for designing and analyzing a class of universal switch blocks which accommodate all types of nets routed through them and show theoretically and experimentally that they outperform the switch blocks currently available For switch matrices we show the nonexistence of their universality analyze the routability of commercially available architectures and present effective approaches for designing good switch matrices Routing We show a class of network flow based approximation algorithms for a switch module routing problem and prove that they have guaranteed constant performance bounds Solutions to this switch module routing problem pave the way for developing a novel congestion metric for FPGA global routing Experimental results show that the new metric significantly improves a router s area performance Area and speed are two most important concerns in router design To consider area and speed simultaneously we study a model of timing driven routing arising from the special properties of FPGA routing architectures We explore the complexity of this problem and present efficient and effective approximation algorithms for the problem

Architecture and CAD for Nanoscale and 3d FPGA Chen Dong,2011 FPGAs field programmable gate arrays are attractive alternatives compared to ASICs application specific integrated circuits for significantly lowering amortized manufacturing costs and dramatically improving design productivity The architecture of an FPGA is very regular It is relatively easy to design a highly optimized tile with consideration of various manufacturing related issues and then to replicate it many times across the chip The configurability of FPGAs also enables yield improvement and defect tolerance However FPGAs are still facing serious challenges in terms of delay power consumption and logic density compared to ASICs FPGA is estimated to be over twenty times less efficient in logic density over three times worse in delay and over ten times higher in power consumption compared to a functionally equivalent ASIC One promising way to improve FPGA performance is to incorporate three dimensional 3D integration which increases the number of active layers and optimizes the interconnect network vertically Another solution is to apply novel nanoelectronic materials nanomaterials and devices This dissertation introduces three novel reconfigurable architectures named 3D nFPGA FPCNA field programmable carbon nanotube array and NEM FPGA nanoelectromechanical FPGA which utilize 3D integration techniques and new nanoscale materials synergistically Customized CAD flows that consider process variation have been developed for different architectures to evaluate their potential performances Also described is a 3D variation aware routing flow which is an essential tool for future 3D FPGA architecture exploration 3D nFPGA is based on CMOS complementary metal oxide semiconductor and nano hybrid techniques that incorporate nanomaterials such as nanowire crossbars and carbon nanotube bundles into the CMOS fabrication process Using unique features of FPGAs and a novel 3D stacking method enabled by the application of nanomaterials 3D nFPGA obtains a 4 7 footprint reduction comparing to the traditional CMOS based 2D FPGAs The performance and power of 3D nFPGA driven by the 20 largest MCNC microelectronics center of North Carolina

benchmarks have been evaluated Results demonstrate that 3D nFPGA is able to provide a performance gain of 2.67 with a small power overhead compared to the traditional 2D FPGA FPCNA includes lookup tables created entirely from continuous carbon nanotube CNT ribbons To determine the performance of the building blocks variation aware physical design tools are used with statistical static timing analysis SSTA that can handle both Gaussian and non Gaussian random variables A 2.757 performance improvement is seen over an equivalent CMOS FPGA at a 95% yield In addition FPCNA offers a 5.7 footprint reduction compared to a baseline FPGA 3D NEM FPGA is the architecture that utilizes nanoelectromechanical NEM relays and 3D integration techniques synergistically This proposed architecture has unique features including a hybrid CMOS NEM FPGA lookup table LUT and configurable logic block CLB NEM based switch block SB and connection block CB and face to face 3D stacking This architecture also has a built in feature called direct link which takes advantage of the short vertical wire length provided by 3D stacking to further enhance performance An overall 46.3% critical path delay reduction has been observed compared to its CMOS counterpart To maximize the potential performance gain of 3D integrated circuit architectures an SSTA engine was developed to deal with both uncorrelated and correlated variations in 3D FPGAs The effects of intra die and inter die variation are considered Using the 3D physical design tool TPR as a base a new 3D routing algorithm is developed which improves the average performance of two layer designs by over 22% and three layer designs by over 27%
