3 1,200 150 6 +1,356

37,516

A. Solve the same multiplication problem using the standard algorithm.

4 5 2

x 8 3

1 3 5 6

+ 3 6 1 6 0

3 7 5 1 6

B. Taylor says she can use the same area model for the problem 4.52×83 and knows the product is 375.16. Explain how Taylor knows this.

2 points

Taylor can do this because all of the digits are the same. The only difference is the place names of the numbers. Instead of my number being a whole number (37,516) my number will have a hundredths place because 4.52 has a hundredths place. I need to have 2 digits after my decimal point. The problem is 4.52 and that is the same as 452 hundredths. The problem but the numbers are in different places.

C. Use Taylor's method to find the product.

1 point

Again, because the numbers are the same. The only difference will be the place names. The number 37,516 has a hundredths place (one digit after the decimal) so my product only needs a tenths place.

$4.52 \times 8.3 = 3.7516$

Math Performance Assessments Ruth Melendez, 2001-03-14 This guide includes teacher tested reproducible performance assessment tasks and rubrics for math that are correlated to the NCTM standards and come complete with a student sheet simple scoring rubric teaching tips and sample student work Illustrations

Abstract Mathematical Cognition Wolfgang Grodd, Philippe Chassy, 2016-08-09 Despite the importance of mathematics in our educational systems little is known about how abstract mathematical thinking emerges Under the uniting thread of mathematical development we hope to connect researchers from various backgrounds to provide an integrated view of abstract mathematical cognition Much progress has been made in the last 20 years on how numeracy is acquired Experimental psychology has brought to light the fact that numerical cognition stems from spatial cognition The findings from neuroimaging and single cell recording experiments converge to show that numerical representations take place in the intraparietal sulcus Further research has demonstrated that supplementary neural networks might be recruited to carry out subtasks for example the retrieval of arithmetic facts is done by the angular gyrus Now that the neural networks in charge of basic mathematical cognition are identified we can move onto the stage where we seek to understand how these basics skills are used to support the acquisition and use of abstract mathematical concepts

Linguistic Influences on Mathematical Cognition Ann Dowker, Hans-Christoph Nuerk, 2017-06-16 For many years an abstract amodal semantic magnitude representation largely independent of verbal linguistic representations has been viewed as the core numerical or mathematical representation This assumption has been substantially challenged in recent years Linguistic properties affect not only verbal representations of numbers but also numerical magnitude representation spatial magnitude representations calculation parity representation place value representation and even early number acquisition Thus we postulate that numerical and arithmetic processing are not fully independent of linguistic processing This is not to say that in patients magnitude processing cannot function independently of linguistic processing we just suppose these functions are connected in the functioning brain So far much research about linguistic influences on numerical cognition has simply demonstrated that language influences number without investigating the level at which a particular language influence operates After an overview we present new findings on language influences on seven language levels Conceptual Conceptual properties of language Syntactic The grammatical structure of languages beyond the word level influences Semantic The semantic meaning or existence of words Lexical The lexical composition of words in particular number words Visuo spatial orthographic Orthographic properties such as the writing reading direction of a language Phonological Phonological phonetic properties of languages Other language related skills Verbal working memory and other cognitive skills related to language representations We hope that this book provides a new and structured overview on the exciting influences of linguistic processing on numerical cognition at almost all levels of language processing
