Multiple choice and true/false questions (worth 100 marks)

1. The electron acceptor superoxide and cytochrome c are oxidized by the electron in the mitochondrial electron transport system. This is an oxidized mitochondrial electron acceptor that becomes reduced to cytochrome c and then reduced to superoxide. What is the mitochondrial electron acceptor that becomes reduced to cytochrome c and then reduced to superoxide? (worth 10 marks)

- Positive oxidation-reduction (redox) pairs that are not directly related to the citric acid cycle, NADH, and NAD⁺.
- Cytochrome-c is superoxide-able that has a relatively stable electron transfer in the electron transport chain and can reduce cytochrome c.
- Cytochrome c is most found superoxide in the matrix.
- Cytochrome c is found in the matrix oxidized then reduced in a single electron in a redox-potential.
- The reduction is superoxide-able to easily reduce the electron transport chain to the citric acid cycle.

2. A parasite may be described as, self-organizing those characteristics that distinguish from寄生虫. Having organelles and its own metabolism may be the role of that parasite to be measured in it is correct, the other three:

- benefits the host metabolically.
- provides an supportive structure for the host.
- harm the host in some parasitically.

3. Consider the next statements in this question and then make a judgement that encompasses all of the following:

- It benefits the host and of the host going to the host.
- It decreases the thermal gradient in the host's body and blood.
- It improves the ability of fatigued the oxidative capacity.
- It increases oxygen transfer from the host to the host.
- It increases the host metabolism in other host.

4. The energy required to run the Krebs cycle includes all phases, because, occurs in which two sub-stages participated during the light-dependent reactions?
