*and experimental investigations of distribution of gaseous emissions with the air flow in the indoor environment* Umer  
Afzal, 2017 There are many sources of emissions produced by burning fuel for power or heat through chemical reactions and  
from leaks from industrial processes or equipment There is always a possibility of a potential hazard when these gases enter  
into the indoor environment with the air flow The determination of the concentration profiles are necessary to evaluate the  
potential hazard posed by the gas spread The main objectives of this work are to develop an appropriate measurement  
methodology and a 3D CFD transient multicomponent simulation model for the determination of spatial and temporal  
distribution of gaseous emissions with the air flow in the indoor environment This work is also aimed at comparing the  
numerical simulation results of different CFD programs for a 2D base case model of indoor air flow with and without  
emission source under laminar and turbulent flow conditions for the purpose of developing a better basic understanding of  
the physical phenomena and for the selection of the suitable and appropriate CFD program for the further development of  
the simulation model One of the goals is also to apply the developed simulation model to the loss prevention and risk  
mitigation in the indoor environment and to study the influence of different parameters on the concentration distribution of  
gaseous pollutants in the presence of air flow in the indoor environment to minimize the expensive and time consuming  
experimentation efforts      *ANSYS Command Reference Guide* Swanson Analysis Systems, 1987      **The Maritime**
