# How to Make a Lava Lamp

## What Happened.

A lava lamp works because of two different scientific principles: density and polarity.

Density is the measurement of how compact a substance is. The higher it is, the more compact it is.

If you compare the equal volumes of oil and water you'll find that the water is heavier than the oil. Water is heavier which will make it go to the bottom of it.

Water and oil don't mix because they have different polarities. Water is polar and oil is non-polar. They have a repulsive electrical charge that prevents them from mixing.

Oil molecules however, are non-polar. They don't have a positive charge, so they are not attracted to the water molecules at all. This is why oil and water don't mix. Instead of mixing a light color, the water and oil stay separate. The Alka-Seltzer makes the water so porous that the oil bubbles up. The bubbles rise and the water so porous that the oil bubbles up. The bubbles rise and the water so porous that the oil bubbles up.

## What You Do

1. Fill the bottle with water.
2. Add the rest of the food coloring.
3. Add the oil.
4. Add the Alka-Seltzer.
